

Permutations Ex 16.5 Q14

Total number of digits = 7

Since, 0 cannot be first digit of the 7 digit numbers.

∴ Number of 6 – digit

$$\begin{aligned} \text{Numbers} &= \frac{6!}{2!3!} \quad \left[\begin{array}{l} \because 2 \text{ comes} \\ 2 \text{ times and 3 comes 3 times} \end{array} \right] \\ &= \frac{6 \times 5 \times 4 \times 3!}{2 \times 3!} \\ &= 6 \times 5 \times 2 \\ &= 60. \end{aligned}$$

$$\begin{aligned} \text{Now, number of 7-digit numbers} &= \frac{7!}{2!3!} = \frac{7 \times 6 \times 5 \times 4 \times 3!}{2 \times 3!} \\ &= 7 \times 6 \times 5 \times 2 \\ &= 420 \end{aligned}$$

Hence, total number of numbers which is greater than 1 million = 420 – 60

= 360.

Permutations Ex 16.5 Q15

There are three copies each of 4 different books.

∴ Total number of copies = 12

∴ The number of ways in which these copies arranged in a shelf

$$\begin{aligned} &= \frac{12!}{3!3!3!3!} \\ &= \frac{12!}{(3!)^4} \end{aligned}$$

Hence, required number of ways

$$= \frac{12!}{(3!)^4}$$

Permutations Ex 16.5 Q16

There are 11 letters in the word 'MATHEMATICS' out of which 2 are M's, 2 are A's, 2 are T's and the rest are all distinct.

$$\text{so, the requisite number of words} = \frac{11!}{2!2!2!}$$

If we fix C in the beginning, then the remaining 10 letters can be arranged in $\frac{10!}{2!2!2!}$

If we fix T in the beginning, then the remaining 10 letters can be arranged in $\frac{10!}{2!2!2!}$

Permutations Ex 16.5 Q17

Total number of molecules = 12

Now,

the chain contains 4 different molecules A, c, g, and T, and 3 molecules of each kind.

$$\begin{aligned}\therefore \text{the number of different arrangements} &= \frac{12!}{3! 3! 3! 3!} \\ &= \frac{12 \times 11 \times 10 \times 9 \times 8 \times 7 \times 6 \times 5 \times 4 \times 3!}{3 \times 2 \times 3 \times 2 \times 3 \times 2 \times 3!} \\ &= 369600.\end{aligned}$$

Hence, the number of different possible arrangements are = 369600.

***** END *****
