

Answer

It is given that  $*$ :  $\mathbf{R} \times \mathbf{R} \rightarrow \mathbf{R}$  and  $\circ$ :  $\mathbf{R} \times \mathbf{R} \rightarrow \mathbf{R}$  is defined as

$$a * b = |a - b| \text{ and } a \circ b = a, \quad \forall a, b \in \mathbf{R}.$$

For  $a, b \in \mathbf{R}$ , we have:

$$a * b = |a - b|$$

$$b * a = |b - a| = |-(a - b)| = |a - b|$$

$$\therefore a * b = b * a$$

$\therefore$  The operation  $*$  is commutative.

It can be observed that,

$$(1 * 2) * 3 = (|1 - 2|) * 3 = 1 * 3 = |1 - 3| = 2$$

$$1 * (2 * 3) = 1 * (|2 - 3|) = 1 * 1 = |1 - 1| = 0$$

$$\therefore (1 * 2) * 3 \neq 1 * (2 * 3) \text{ (where } 1, 2, 3 \in \mathbf{R})$$

$\therefore$  The operation  $*$  is not associative.

Now, consider the operation  $\circ$ :

It can be observed that  $1 \circ 2 = 1$  and  $2 \circ 1 = 2$ .

$$\therefore 1 \circ 2 \neq 2 \circ 1 \text{ (where } 1, 2 \in \mathbf{R})$$

$\therefore$  The operation  $\circ$  is not commutative.

Let  $a, b, c \in \mathbf{R}$ . Then, we have:

$$(a \circ b) \circ c = a \circ c = a$$

$$a \circ (b \circ c) = a \circ b = a$$

$$\Rightarrow (a \circ b) \circ c = a \circ (b \circ c)$$

$\therefore$  The operation  $\circ$  is associative.

Now, let  $a, b, c \in \mathbf{R}$ , then we have:

$$a * (b \circ c) = a * b = |a - b|$$

$$(a * b) \circ (a * c) = (|a - b|) \circ (|a - c|) = |a - b|$$

$$\text{Hence, } a * (b \circ c) = (a * b) \circ (a * c).$$

Now,

$$1 \circ (2 * 3) = 1 \circ (|2 - 3|) = 1 \circ 1 = 1$$

$$(1 \circ 2) * (1 \circ 3) = 1 * 1 = |1 - 1| = 0$$

$$\therefore 1 \circ (2 * 3) \neq (1 \circ 2) * (1 \circ 3) \text{ (where } 1, 2, 3 \in \mathbf{R})$$

$\therefore$  The operation  $\circ$  does not distribute over  $*$ .

#### Question 13:

Given a non-empty set  $X$ , let  $*$ :  $P(X) \times P(X) \rightarrow P(X)$  be defined as  $A * B = (A - B) \cup (B - A)$ ,  $\forall A, B \in P(X)$ . Show that the empty set  $\Phi$  is the identity for the operation  $*$  and all the elements  $A$  of  $P(X)$  are invertible with  $A^{-1} = A$ . (Hint:  $(A - \Phi) \cup (\Phi - A) = A$  and  $(A - A) \cup (A - A) = A * A = \Phi$ ).

Answer

It is given that  $*$ :  $P(X) \times P(X) \rightarrow P(X)$  is defined as

$$A * B = (A - B) \cup (B - A) \quad \forall A, B \in P(X).$$

Let  $A \in P(X)$ . Then, we have:

$$A * \Phi = (A - \Phi) \cup (\Phi - A) = A \cup \Phi = A$$

$$\Phi * A = (\Phi - A) \cup (A - \Phi) = \Phi \cup A = A$$

$$\therefore A * \Phi = A = \Phi * A. \quad \forall A \in P(X)$$

Thus,  $\Phi$  is the identity element for the given operation  $*$ .

Now, an element  $A \in P(X)$  will be invertible if there exists  $B \in P(X)$  such that

$$A * B = \Phi = B * A. \text{ (As } \Phi \text{ is the identity element)}$$

$$\text{Now, we observed that } A * A = (A - A) \cup (A - A) = \Phi \cup \Phi = \Phi \quad \forall A \in P(X).$$

Hence, all the elements  $A$  of  $P(X)$  are invertible with  $A^{-1} = A$ .

#### Question 14:

Define a binary operation  $*$  on the set  $\{0, 1, 2, 3, 4, 5\}$  as

$$a * b = \begin{cases} a + b, & \text{if } a + b < 6 \\ a + b - 6 & \text{if } a + b \geq 6 \end{cases}$$

Show that zero is the identity for this operation and each element  $a \neq 0$  of the set is invertible with  $a^{-1} = a$  being the inverse of  $a$ .

invertible with  $b = 6 - a$  being the inverse of  $a$ .

Answer

Let  $X = \{0, 1, 2, 3, 4, 5\}$ .

The operation  $*$  on  $X$  is defined as:

$$a * b = \begin{cases} a + b & \text{if } a + b < 6 \\ a + b - 6 & \text{if } a + b \geq 6 \end{cases}$$

An element  $e \in X$  is the identity element for the operation  $*$ , if  $a * e = a = e * a \forall a \in X$ .

For  $a \in X$ , we observed that:

$$a * 0 = a + 0 = a \quad [a \in X \Rightarrow a + 0 < 6]$$

$$0 * a = 0 + a = a \quad [a \in X \Rightarrow 0 + a < 6]$$

$$\therefore a * 0 = a = 0 * a \forall a \in X$$

Thus, 0 is the identity element for the given operation  $*$ .

An element  $a \in X$  is invertible if there exists  $b \in X$  such that  $a * b = 0 = b * a$ .

$$\text{i.e., } \begin{cases} a + b = 0 = b + a, & \text{if } a + b < 6 \\ a + b - 6 = 0 = b + a - 6, & \text{if } a + b \geq 6 \end{cases}$$

i.e.,

$$a = -b \text{ or } b = 6 - a$$

But,  $X = \{0, 1, 2, 3, 4, 5\}$  and  $a, b \in X$ . Then,  $a \neq -b$ .

$\therefore b = 6 - a$  is the inverse of  $a \quad \square \quad a \in X$ .

Hence, the inverse of an element  $a \in X, a \neq 0$  is  $6 - a$  i.e.,  $a^{-1} = 6 - a$ .

#### Question 15:

Let  $A = \{-1, 0, 1, 2\}$ ,  $B = \{-4, -2, 0, 2\}$  and  $f, g: A \rightarrow B$  be functions defined by  $f(x) =$

$$x^2 - x, x \in A \text{ and } g(x) = 2 \left\lfloor x - \frac{1}{2} \right\rfloor - 1, x \in A. \text{ Are } f \text{ and } g \text{ equal?}$$

Justify your answer. (Hint: One may note that two function  $f: A \rightarrow B$  and  $g: A \rightarrow B$  such that  $f(a) = g(a) \quad \square \quad a \in A$ , are called equal functions).

Answer

It is given that  $A = \{-1, 0, 1, 2\}$ ,  $B = \{-4, -2, 0, 2\}$ .

Also, it is given that  $f, g: A \rightarrow B$  are defined by  $f(x) = x^2 - x, x \in A$  and

$$g(x) = 2 \left\lfloor x - \frac{1}{2} \right\rfloor - 1, x \in A.$$

It is observed that:

$$f(-1) = (-1)^2 - (-1) = 1 + 1 = 2$$

$$g(-1) = 2 \left\lfloor (-1) - \frac{1}{2} \right\rfloor - 1 = 2 \left\lfloor -\frac{3}{2} \right\rfloor - 1 = 3 - 1 = 2$$

$$\Rightarrow f(-1) = g(-1)$$

$$f(0) = (0)^2 - 0 = 0$$

$$g(0) = 2 \left\lfloor 0 - \frac{1}{2} \right\rfloor - 1 = 2 \left\lfloor -\frac{1}{2} \right\rfloor - 1 = 1 - 1 = 0$$

$$\Rightarrow f(0) = g(0)$$

$$f(1) = (1)^2 - 1 = 1 - 1 = 0$$

$$g(1) = 2 \left\lfloor 1 - \frac{1}{2} \right\rfloor - 1 = 2 \left\lfloor \frac{1}{2} \right\rfloor - 1 = 1 - 1 = 0$$

$$\Rightarrow f(1) = g(1)$$

$$f(2) = (2)^2 - 2 = 4 - 2 = 2$$

$$g(2) = 2 \left\lfloor 2 - \frac{1}{2} \right\rfloor - 1 = 2 \left\lfloor \frac{3}{2} \right\rfloor - 1 = 3 - 1 = 2$$

$$\Rightarrow f(2) = g(2)$$

$$\therefore f(a) = g(a) \quad \forall a \in A$$

Hence, the functions  $f$  and  $g$  are equal.

#### Question 16:

Let  $A = \{1, 2, 3\}$ . Then number of relations containing  $(1, 2)$  and  $(1, 3)$  which are reflexive and symmetric but not transitive is

(A) 1 (B) 2 (C) 3 (D) 4

Answer

The given set is  $A = \{1, 2, 3\}$ .

The smallest relation containing  $(1, 2)$  and  $(1, 3)$  which is reflexive and symmetric, but not transitive is given by:

$$R = \{(1, 1), (2, 2), (3, 3), (1, 2), (1, 3), (2, 1), (3, 1)\}$$

This is because relation  $R$  is reflexive as  $(1, 1), (2, 2), (3, 3) \in R$ .

Relation  $R$  is symmetric since  $(1, 2), (2, 1) \in R$  and  $(1, 3), (3, 1) \in R$ .

But relation  $R$  is not transitive as  $(3, 1), (1, 2) \in R$ , but  $(3, 2) \notin R$ .

Now, if we add any two pairs  $(3, 2)$  and  $(2, 3)$  (or both) to relation  $R$ , then relation  $R$  will become transitive.

Hence, the total number of desired relations is one.

The correct answer is A.

**Question 17:**

Let  $A = \{1, 2, 3\}$ . Then number of equivalence relations containing  $(1, 2)$  is

(A) 1 (B) 2 (C) 3 (D) 4

Answer

It is given that  $A = \{1, 2, 3\}$ .

The smallest equivalence relation containing  $(1, 2)$  is given by,

$$R_1 = \{(1, 1), (2, 2), (3, 3), (1, 2), (2, 1)\}$$

Now, we are left with only four pairs i.e.,  $(2, 3), (3, 2), (1, 3)$ , and  $(3, 1)$ .

If we add any one pair [say  $(2, 3)$ ] to  $R_1$ , then for symmetry we must add  $(3, 2)$ . Also, for transitivity we are required to add  $(1, 3)$  and  $(3, 1)$ .

Hence, the only equivalence relation (bigger than  $R_1$ ) is the universal relation.

This shows that the total number of equivalence relations containing  $(1, 2)$  is two.

The correct answer is B.

**Question 18:**

Let  $f: \mathbf{R} \rightarrow \mathbf{R}$  be the Signum Function defined as

$$f(x) = \begin{cases} 1, & x > 0 \\ 0, & x = 0 \\ -1, & x < 0 \end{cases}$$

and  $g: \mathbf{R} \rightarrow \mathbf{R}$  be the Greatest Integer Function given by  $g(x) = [x]$ , where  $[x]$  is greatest integer less than or equal to  $x$ . Then does  $f \circ g$  and  $g \circ f$  coincide in  $(0, 1]$ ?

Answer

It is given that,

$$f(x) = \begin{cases} 1, & x > 0 \\ 0, & x = 0 \\ -1, & x < 0 \end{cases}$$

$f: \mathbf{R} \rightarrow \mathbf{R}$  is defined as

Also,  $g: \mathbf{R} \rightarrow \mathbf{R}$  is defined as  $g(x) = [x]$ , where  $[x]$  is the greatest integer less than or equal to  $x$ .

Now, let  $x \in (0, 1]$ .

Then, we have:

$$[x] = 1 \text{ if } x = 1 \text{ and } [x] = 0 \text{ if } 0 < x < 1.$$

$$\therefore f \circ g(x) = f(g(x)) = f([x]) = \begin{cases} f(1), & \text{if } x = 1 \\ f(0), & \text{if } x \in (0, 1) \end{cases} = \begin{cases} 1, & \text{if } x = 1 \\ 0, & \text{if } x \in (0, 1) \end{cases}$$

$$\begin{aligned} g \circ f(x) &= g(f(x)) \\ &= g(1) \quad [x > 0] \\ &= [1] = 1 \end{aligned}$$

Thus, when  $x \in (0, 1)$ , we have  $f \circ g(x) = 0$  and  $g \circ f(x) = 1$ .

Hence,  $f \circ g$  and  $g \circ f$  do not coincide in  $(0, 1]$ .

**Question 19:**

Number of binary operations on the set  $\{a, b\}$  are

(A) 10 (B) 16 (C) 20 (D) 8

Answer

A binary operation  $*$  on  $\{a, b\}$  is a function from  $\{a, b\} \times \{a, b\} \rightarrow \{a, b\}$

i.e.,  $*$  is a function from  $\{(a, a), (a, b), (b, a), (b, b)\} \rightarrow \{a, b\}$ .

Hence, the total number of binary operations on the set  $\{a, b\}$  is  $2^4$  i.e., 16.

The correct answer is B.

\*\*\*\*\* END \*\*\*\*\*
