

# Properties of Triangles Ex 15.2 Q24

Answer :

In the given triangle,  $\angle ACD = \angle A + \angle B$ . (Exterior angle is equal to the sum of two opposite interior angles.)

We know that the sum of all three angles of a triangle is  $180^\circ$ .

Therefore, for the given triangle, we can say that :

$$\angle ABC + \angle BCA + \angle CAB = 180^\circ. \text{ (Sum of all angles of } \triangle ABC \text{)}$$

$$\angle A + \angle B + \angle BCA = 180^\circ$$

$$\angle BCA = 180^\circ - (\angle A + \angle B)$$

$$\angle ECA = \frac{\angle ACD}{2} \text{ (}\because \text{EC bisects } \angle ACD \text{)}$$

$$\angle ECA = \frac{\angle A + \angle B}{2} \text{ (}\because \angle ACD = \angle A + \angle B \text{)}$$

$$\angle EBC = \frac{\angle ABC}{2} = \frac{\angle B}{2} \text{ (}\because \text{EB bisects } \angle ABC \text{)}$$

$$\angle ECB = \angle ECA + \angle BCA$$

$$\Rightarrow \angle ECB = \frac{\angle A + \angle B}{2} + 180^\circ - (\angle A + \angle B)$$

If we use the same logic for  $\triangle EBC$ , we can say that :

$$\angle EBC + \angle ECB + \angle BEC = 180^\circ \text{ (Sum of all angles of } \triangle EBC \text{)}$$

$$\frac{\angle B}{2} + \frac{\angle A + \angle B}{2} + 180^\circ - (\angle A + \angle B) + \angle BEC = 180^\circ$$

$$\angle BEC = \angle A + \angle B - \left( \frac{\angle A + \angle B}{2} \right) - \frac{\angle B}{2}$$

$$\angle BEC = \frac{\angle A}{2}$$

$$\Rightarrow \angle BEC = \frac{50^\circ}{2} = 25^\circ$$

# Properties of Triangles Ex 15.2 Q25

Answer :

We know that the sum of all angles of a triangle is  $180^\circ$ .

Therefore, for  $\triangle ABC$ , we can say that :

$$\angle A + \angle B + \angle C = 180^\circ$$

Or,

$$\angle A + 60^\circ + 40^\circ = 180^\circ$$

$$\Rightarrow \angle A = 80^\circ$$

$$\angle DAC = \frac{\angle A}{2} \quad (\because AD \text{ bisects } \angle A)$$

$$\Rightarrow \angle DAC = \frac{80^\circ}{2} = 40^\circ$$

If we use the above logic on  $\triangle ADC$ , we can say that :

$$\angle ADC + \angle DCA + \angle DAC = 180^\circ. \quad (\text{Sum of all the angles of } \triangle ADC)$$

$$\angle ADC + 40^\circ + 40^\circ = 180^\circ$$

$$\angle ADC = 180^\circ - 80^\circ = 100^\circ$$

$$\angle ADC = \angle ALD + \angle LAD \quad (\text{Exterior angle is equal to the sum of two Interior opposite angles.})$$

$$100^\circ = 90^\circ + \angle LAD \quad (\because AL \perp BC)$$

$$\angle LAD = 10^\circ$$
