

Surface Areas and Volumes Ex.16.1 Q13

Answer :

The height and radius of the cylindrical bucket are $h = 32$ cm and $r = 18$ cm respectively. Therefore, the volume of the cylindrical bucket is

$$\begin{aligned} V &= \pi r^2 h \\ &= \frac{22}{7} \times (18)^2 \times 32 \end{aligned}$$

The bucket is full of sand and is emptied in the ground to form a conical heap of sand of height $h_1 = 24$ cm. Let, the radius and slant height of the conical heap be r_1 cm and l_1 cm respectively. Then, we have

$$\begin{aligned} l_1^2 &= r_1^2 + h_1^2 \\ \Rightarrow r_1^2 &= l_1^2 - h_1^2 \\ \Rightarrow r_1^2 &= l_1^2 - (24)^2 \end{aligned}$$

The volume of the conical heap is

$$\begin{aligned} V_1 &= \frac{1}{3} \pi r_1^2 h_1 \\ &= \frac{1}{3} \times \frac{22}{7} \times r_1^2 \times 24 \\ &= \frac{22}{7} \times r_1^2 \times 8 \end{aligned}$$

Since, the volume of the cylindrical bucket and conical hear are same, we have

$$\begin{aligned} V_1 &= V \\ \Rightarrow \frac{22}{7} \times r_1^2 \times 8 &= \frac{22}{7} \times (18)^2 \times 32 \\ \Rightarrow r_1^2 &= (18)^2 \times 4 \\ \Rightarrow r_1 &= 18 \times 2 \\ \Rightarrow r_1 &= 36 \end{aligned}$$

Then, we have

$$\begin{aligned} l_1^2 &= r_1^2 + h_1^2 \\ \Rightarrow l_1^2 &= (36)^2 + (24)^2 \\ \Rightarrow l_1 &= 43.27 \end{aligned}$$

Therefore, the radius and the slant height of the conical heap are 36 cm and 43.27 cm respectively.

Surface Areas and Volumes Ex.16.1 Q14

Answer :

The fallen rains are in the form of a cuboid of height 1 cm, length 6 m = 600 cm and breadth 4 m = 400 cm. Therefore, the volume of the fallen rains is

$$V = 600 \times 400 \times 1 = 240000 \text{ cm}^3$$

The fallen rains are transferred into a cylindrical vessel of internal radius $r_1 = 20$ cm. Let, the height of the water in the cylindrical vessel is h_1 cm. Then, the volume of the water in the cylinder is

$$V_1 = \pi r_1^2 h_1 = \frac{22}{7} \times (20)^2 \times h_1$$

Since, the volume of the water in the cylinder is same as the volume of the rainfalls, we have

$$\begin{aligned} V_1 &= V \\ \Rightarrow \frac{22}{7} \times (20)^2 \times h_1 &= 240000 \\ \Rightarrow h_1 &= \frac{240000 \times 7}{(20)^2 \times 22} \\ \Rightarrow h_1 &= 190.9 \end{aligned}$$

Therefore, the height of the water in the cylinder is 190.9 cm.

Surface Areas and Volumes Ex.16.1 Q15

Answer :

The base-radius and height of the conical flask are r and h respectively. Let, the slant height of the conical flask is l . Therefore, the volume of the water in the conical flask is

$$V = \frac{1}{3} \times \pi \times r^2 \times h$$

The water in the conical flask is poured into a cylindrical flask of base-radius mr . Let, the height of the water in the cylindrical flasks is h_1 . Then, the volume of the water in the cylindrical flasks is

$$V_1 = \pi \times (mr)^2 \times h_1$$

Since, the volume of the water in the cylindrical flasks is same as the volume of the water in the conical flasks, we have

$$V_1 = V$$

$$\Rightarrow \pi \times (mr)^2 \times h_1 = \frac{1}{3} \times \pi \times r^2 \times h$$

$$\Rightarrow m^2 \times h_1 = \frac{1}{3} \times h$$

$$\Rightarrow h_1 = \frac{h}{3m^2}$$

Therefore, the height of the water in the cylinder is $\boxed{\frac{h}{3m^2}}$

***** END *****
