

Linear Equations in Two Variables Ex 13.3 Q4

Answer :

The number given to us is in the form of yx ,

where y represents the ten's place of the number

And x represents the unit's place of the number

Now, the given number is

$$10y + x$$

number obtained by reversing the digits of the number is

$$10x + y$$

It is given to us that the original number is 27 more than the number obtained by reversing its digits

So,

$$10y + x = 10x + y + 27$$

$$10y - y + x - 10x = 27$$

$$9y - 9x = 27$$

$$9(y - x) = 27$$

$$y - x = \frac{27}{9}$$

$$y - x = 3$$

$$x - y + 3 = 0$$

Linear Equations in Two Variables Ex 13.3 Q5

Answer :

The number given to us is in the form of yx .

where y represents the ten's place of the number

And x represents the units place of the number

Now, the given number is

$$10y + x$$

number obtained by reversing the digits of the number is

$$10x + y$$

It is given to us that the sum of these two numbers is 121

So,

$$(10y + x) + (10x + y) = 121$$

$$10y + y + x + 10x = 121$$

$$11y + 11x = 121$$

$$11(y + x) = 121$$

$$x + y = \frac{121}{11}$$

$$x + y = 11$$

$$x + y - 11 = 0$$

Linear Equations in Two Variables Ex 13.3 Q6

Answer :

The required graph is below:-

By plotting the given points (3, 5) and (-1, 3) on a graph paper, we get the line BC.

We have already plotted the point A (1, 4) on the given plane by the intersecting lines.

Therefore, it is proved that the straight line passing through (3, 5) and (-1, 3) also passes through A (1, 4).
