

Functions Ex2.2 Q8

Let  $f: \mathbb{R} \rightarrow \mathbb{R}$  and  $g: \mathbb{R} \rightarrow \mathbb{R}$  are defined as

$$f(x) = x + 1 \text{ and } g(x) = x - 1$$

Now,

$$\begin{aligned} f \circ g(x) &= f(g(x)) = f(x - 1) = x - 1 + 1 \\ &= x = I_{\mathbb{R}} \dots\dots\dots (i) \end{aligned}$$

Again,

$$\begin{aligned} f \circ g(x) &= f(g(x)) = g(x + 1) = x + 1 - 1 \\ &= x = I_{\mathbb{R}} \dots\dots\dots (ii) \end{aligned}$$

from (i) & (ii)

$$f \circ g = g \circ f = I_{\mathbb{R}}$$

Functions Ex2.2 Q9

We have,  $f: \mathbb{N} \rightarrow \mathbb{Z}_0$ ,  $g: \mathbb{Z}_0 \rightarrow \mathbb{Q}$  and  
 $h: \mathbb{Q} \rightarrow \mathbb{R}$

$$\text{Also, } f(x) = 2x, \quad g(x) = \frac{1}{x} \text{ and } h(x) = e^x$$

Now,  $f: \mathbb{N} \rightarrow \mathbb{Z}_0$  and  $h \circ g: \mathbb{Z}_0 \rightarrow \mathbb{R}$

$$\therefore (h \circ g) \circ f: \mathbb{N} \rightarrow \mathbb{R}$$

also,  $g \circ f: \mathbb{N} \rightarrow \mathbb{Q}$  and  $h: \mathbb{Q} \rightarrow \mathbb{R}$

$$\therefore h \circ (g \circ f): \mathbb{N} \rightarrow \mathbb{R}$$

Thus,  $(h \circ g) \circ f$  and  $h \circ (g \circ f)$  exist and are function from  $\mathbb{N}$  to set  $\mathbb{R}$ .

$$\begin{aligned} \text{Finally, } (h \circ g) \circ f(x) &= (h \circ g)(f(x)) = (h \circ g)(2x) \\ &= h\left(\frac{1}{2x}\right) \\ &= e^{\frac{1}{2x}} \end{aligned}$$

$$\begin{aligned} \text{now, } h \circ (g \circ f)(x) &= h(g(2x)) = h\left(\frac{1}{2x}\right) \\ &= e^{\frac{1}{2x}} \end{aligned}$$

Hence, associativity verified.

Functions Ex2.2 Q10

We have,

$$\begin{aligned}h \circ (g \circ f)(x) &= h(g \circ f(x)) = h(g(f(x))) \\&= h(g(2x)) = h(3(2x) + 4) \\&= h(6x + 4) = \sin(6x + 4) \quad \forall x \in \mathbf{N} \\((h \circ g) \circ f)(x) &= (h \circ g)(f(x)) = (h \circ g)(2x) \\&= h(g(2x)) = h(3(2x) + 4) \\&= h(6x + 4) = \sin(6x + 4) \quad \forall x \in \mathbf{N}\end{aligned}$$

This shows,  $h \circ (g \circ f) = (h \circ g) \circ f$

Functions Ex2.2 Q11

Define  $f: \mathbf{N} \rightarrow \mathbf{N}$  by,  $f(x) = x + 1$

And,  $g: \mathbf{N} \rightarrow \mathbf{N}$  by,

$$g(x) = \begin{cases} x-1 & \text{if } x > 1 \\ 1 & \text{if } x = 1 \end{cases}$$

We first show that  $f$  is not onto.

For this, consider element 1 in co-domain  $\mathbf{N}$ . It is clear that this element is not an image of any of the elements in domain  $\mathbf{N}$ .

Therefore,  $f$  is not onto.

Now,  $g \circ f: \mathbf{N} \rightarrow \mathbf{N}$  is defined by,

Functions Ex2.2 Q12

Define  $f: \mathbf{N} \rightarrow \mathbf{Z}$  as  $f(x) = x$  and  $g: \mathbf{Z} \rightarrow \mathbf{Z}$  as  $g(x) = |x|$ .

We first show that  $g$  is not injective.

It can be observed that:

$$g(-1) = |-1| = 1$$

$$g(1) = |1| = 1$$

Therefore,  $g(-1) = g(1)$ , but  $-1 \neq 1$ .

Therefore,  $g$  is not injective.

Now,  $g \circ f: \mathbf{N} \rightarrow \mathbf{Z}$  is defined as  $g \circ f(x) = g(f(x)) = g(x) = |x|$ .

Let  $x, y \in \mathbf{N}$  such that  $g \circ f(x) = g \circ f(y)$ .

$$\Rightarrow |x| = |y|$$

Since  $x$  and  $y \in \mathbf{N}$ , both are positive.

$$\therefore |x| = |y| \Rightarrow x = y$$

Hence,  $g \circ f$  is injective

Functions Ex2.2 Q13

We have,  $f: A \rightarrow B$  and  $g: B \rightarrow C$  are one-one functions

Now we have to prove  $g \circ f: A \rightarrow C$  is one-one

let  $x, y \in A$  such that

$$g \circ f(x) = g \circ f(y)$$

$$\Rightarrow g(f(x)) = g(f(y))$$

$$\Rightarrow f(x) = f(y) \quad [\because g \text{ is one-one}]$$

$$\Rightarrow x = y \quad [\because f \text{ is one-one}]$$

$\therefore g \circ f$  is one-one function

Functions Ex2.2 Q14

We have,  $f: A \rightarrow B$  and  $g: B \rightarrow C$  are onto functions.

Now, we need to prove:  $g \circ f: A \rightarrow C$  is onto.

Let  $y \in C$ , then

$$g \circ f(x) = y$$

$$\Rightarrow g(f(x)) = y \dots\dots\dots (i)$$

Since  $g$  is onto, for each element in  $C$ , then exists a preimage in  $B$ .

$$\therefore g(x) = y \dots\dots\dots (ii)$$

From (i) & (ii)

$$f(x) = \alpha.$$

Since  $f$  is onto, for each element in  $B$  there exists a preimage in  $A$

$$\therefore f(x) = \alpha \dots\dots\dots (iii)$$

From (ii) and (iii) we can conclude that for each  $y \in C$ , there exists a preimage in  $A$  such that  $g \circ f(x) = y$

$$\therefore g \circ f \text{ is onto}$$
