

**Question 10:**

Find which of the operations given above has identity.

Answer

An element  $e \in \mathbf{Q}$  will be the identity element for the operation  $*$  if

$$a * e = a = e * a, \quad \forall a \in \mathbf{Q}.$$

However, there is no such element  $e \in \mathbf{Q}$  with respect to each of the six operations satisfying the above condition.

Thus, none of the six operations has identity.

**Question 11:**

Let  $A = \mathbf{N} \times \mathbf{N}$  and  $*$  be the binary operation on  $A$  defined by

$$(a, b) * (c, d) = (a + c, b + d)$$

Show that  $*$  is commutative and associative. Find the identity element for  $*$  on  $A$ , if any.

Answer

$$A = \mathbf{N} \times \mathbf{N}$$

$*$  is a binary operation on  $A$  and is defined by:

$$(a, b) * (c, d) = (a + c, b + d)$$

Let  $(a, b), (c, d) \in A$

Then,  $a, b, c, d \in \mathbf{N}$

We have:

$$(a, b) * (c, d) = (a + c, b + d)$$

$$(c, d) * (a, b) = (c + a, d + b) = (a + c, b + d)$$

[Addition is commutative in the set of natural numbers]

$$\therefore (a, b) * (c, d) = (c, d) * (a, b)$$

Therefore, the operation  $*$  is commutative.

Now, let  $(a, b), (c, d), (e, f) \in A$

Then,  $a, b, c, d, e, f \in \mathbf{N}$

We have:

$$((a, b) * (c, d)) * (e, f) = (a + c, b + d) * (e, f) = (a + c + e, b + d + f)$$

$$(a, b) * ((c, d) * (e, f)) = (a, b) * (c + e, d + f) = (a + c + e, b + d + f)$$

$$\therefore ((a, b) * (c, d)) * (e, f) = (a, b) * ((c, d) * (e, f))$$

Therefore, the operation  $*$  is associative.

An element  $e = (e_1, e_2) \in A$  will be an identity element for the operation  $*$  if

$$a * e = a = e * a \quad \forall a = (a_1, a_2) \in A, \text{ i.e., } (a_1 + e_1, a_2 + e_2) = (a_1, a_2) = (e_1 + a_1, e_2 + a_2), \text{ which is}$$

not true for any element in  $A$ .

Therefore, the operation  $*$  does not have any identity element.

**Question 12:**

State whether the following statements are true or false. Justify.

(i) For an arbitrary binary operation  $*$  on a set  $\mathbf{N}$ ,  $a * a = a \quad \forall a \in \mathbf{N}$ .

(ii) If  $*$  is a commutative binary operation on  $\mathbf{N}$ , then  $a * (b * c) = (c * b) * a$

Answer

(i) Define an operation  $*$  on  $\mathbf{N}$  as:

$$a * b = a + b \quad \forall a, b \in \mathbf{N}$$

Then, in particular, for  $b = a = 3$ , we have:

$$3 * 3 = 3 + 3 = 6 \neq 3$$

Therefore, statement (i) is false.

(ii) R.H.S. =  $(c * b) * a$

$$= (b * c) * a \quad [* \text{ is commutative}]$$

$$= a * (b * c) \quad [\text{Again, as } * \text{ is commutative}]$$

$$= \text{L.H.S.}$$

$$\therefore a * (b * c) = (c * b) * a$$

Therefore, statement (ii) is true.

**Question 13:**

Consider a binary operation  $*$  on  $\mathbf{N}$  defined as  $a * b = a^3 + b^3$ . Choose the correct answer.

- (A) Is  $*$  both associative and commutative?  
 (B) Is  $*$  commutative but not associative?  
 (C) Is  $*$  associative but not commutative?  
 (D) Is  $*$  neither commutative nor associative?

Answer

On  $\mathbf{N}$ , the operation  $*$  is defined as  $a * b = a^3 + b^3$ .

For,  $a, b \in \mathbf{N}$ , we have:

$$a * b = a^3 + b^3 = b^3 + a^3 = b * a \text{ [Addition is commutative in } \mathbf{N}]$$

Therefore, the operation  $*$  is commutative.

It can be observed that:

$$(1 * 2) * 3 = (1^3 + 2^3) * 3 = 9 * 3 = 9^3 + 3^3 = 729 + 27 = 756$$

$$1 * (2 * 3) = 1 * (2^3 + 3^3) = 1 * (8 + 27) = 1 * 35 = 1^3 + 35^3 = 1 + (35)^3 = 1 + 42875 = 42876$$

$$\therefore (1 * 2) * 3 \neq 1 * (2 * 3); \text{ where } 1, 2, 3 \in \mathbf{N}$$

Therefore, the operation  $*$  is not associative.

Hence, the operation  $*$  is commutative, but not associative. Thus, the correct answer is

B.

#### Miscellaneous Questions:

##### Question 1:

Let  $f: \mathbf{R} \rightarrow \mathbf{R}$  be defined as  $f(x) = 10x + 7$ . Find the function  $g: \mathbf{R} \rightarrow \mathbf{R}$  such that  $g \circ f = f \circ g = I_{\mathbf{R}}$ .

Answer

It is given that  $f: \mathbf{R} \rightarrow \mathbf{R}$  is defined as  $f(x) = 10x + 7$ .

One-one:

Let  $f(x) = f(y)$ , where  $x, y \in \mathbf{R}$ .

$$\Rightarrow 10x + 7 = 10y + 7$$

$$\Rightarrow x = y$$

$\therefore f$  is a one-one function.

Onto:

For  $y \in \mathbf{R}$ , let  $y = 10x + 7$ .

$$\Rightarrow x = \frac{y-7}{10} \in \mathbf{R}$$

Therefore, for any  $y \in \mathbf{R}$ , there exists  $x = \frac{y-7}{10} \in \mathbf{R}$  such that

$$f(x) = f\left(\frac{y-7}{10}\right) = 10\left(\frac{y-7}{10}\right) + 7 = y - 7 + 7 = y.$$

$\therefore f$  is onto.

Therefore,  $f$  is one-one and onto.

Thus,  $f$  is an invertible function.

Let us define  $g: \mathbf{R} \rightarrow \mathbf{R}$  as  $g(y) = \frac{y-7}{10}$ .

Now, we have:

$$g \circ f(x) = g(f(x)) = g(10x + 7) = \frac{(10x + 7) - 7}{10} = \frac{10x}{10} = x$$

And,

$$f \circ g(y) = f(g(y)) = f\left(\frac{y-7}{10}\right) = 10\left(\frac{y-7}{10}\right) + 7 = y - 7 + 7 = y$$

$$\therefore g \circ f = I_{\mathbf{R}} \text{ and } f \circ g = I_{\mathbf{R}}$$

Hence, the required function  $g: \mathbf{R} \rightarrow \mathbf{R}$  is defined as  $g(y) = \frac{y-7}{10}$ .

##### Question 2:

Let  $f: \mathbf{W} \rightarrow \mathbf{W}$  be defined as  $f(n) = n - 1$ , if  $n$  is odd and  $f(n) = n + 1$ , if  $n$  is even. Show that  $f$  is invertible. Find the inverse of  $f$ . Here,  $\mathbf{W}$  is the set of all whole numbers.

Answer

It is given that:

$$f(n) = \begin{cases} n-1, & \text{if } n \text{ is odd} \\ n+1, & \text{if } n \text{ is even} \end{cases}$$

$f: \mathbf{W} \rightarrow \mathbf{W}$  is defined as

One-one:

Let  $f(n) = f(m)$ .

It can be observed that if  $n$  is odd and  $m$  is even, then we will have  $n - 1 = m + 1$ .

$$\Rightarrow n - m = 2$$

However, this is impossible.

Similarly, the possibility of  $n$  being even and  $m$  being odd can also be ignored under a similar argument.

$\therefore$  Both  $n$  and  $m$  must be either odd or even.

Now, if both  $n$  and  $m$  are odd, then we have:

$$f(n) = f(m) \Rightarrow n - 1 = m - 1 \Rightarrow n = m$$

Again, if both  $n$  and  $m$  are even, then we have:

$$f(n) = f(m) \Rightarrow n + 1 = m + 1 \Rightarrow n = m$$

$\therefore f$  is one-one.

It is clear that any odd number  $2r + 1$  in co-domain  $\mathbf{N}$  is the image of  $2r$  in domain  $\mathbf{N}$  and any even number  $2r$  in co-domain  $\mathbf{N}$  is the image of  $2r + 1$  in domain  $\mathbf{N}$ .

$\therefore f$  is onto.

Hence,  $f$  is an invertible function.

Let us define  $g: W \rightarrow W$  as:

$$g(m) = \begin{cases} m+1, & \text{if } m \text{ is even} \\ m-1, & \text{if } m \text{ is odd} \end{cases}$$

Now, when  $n$  is odd:

$$g \circ f(n) = g(f(n)) = g(n-1) = n-1+1 = n$$

And, when  $n$  is even:

$$g \circ f(n) = g(f(n)) = g(n+1) = n+1-1 = n$$

Similarly, when  $m$  is odd:

$$f \circ g(m) = f(g(m)) = f(m-1) = m-1+1 = m$$

When  $m$  is even:

$$f \circ g(m) = f(g(m)) = f(m+1) = m+1-1 = m$$

$$\therefore g \circ f = I_W \text{ and } f \circ g = I_W$$

Thus,  $f$  is invertible and the inverse of  $f$  is given by  $f^{-1} = g$ , which is the same as  $f$ .

Hence, the inverse of  $f$  is  $f$  itself.

#### Question 3:

If  $f: \mathbf{R} \rightarrow \mathbf{R}$  is defined by  $f(x) = x^2 - 3x + 2$ , find  $f(f(x))$ .

Answer

It is given that  $f: \mathbf{R} \rightarrow \mathbf{R}$  is defined as  $f(x) = x^2 - 3x + 2$ .

$$\begin{aligned} f(f(x)) &= f(x^2 - 3x + 2) \\ &= (x^2 - 3x + 2)^2 - 3(x^2 - 3x + 2) + 2 \\ &= x^4 + 9x^2 + 4 - 6x^3 - 12x + 4x^2 - 3x^2 + 9x - 6 + 2 \\ &= x^4 - 6x^3 + 10x^2 - 3x \end{aligned}$$

#### Question 4:

\*\*\*\*\* END \*\*\*\*\*
