

Exercise 13B

Q1.

Answer :

(b) 6 days

A can do a work in 10 days.

$$\text{A's 1 day work} = \frac{1}{10}$$

B can do a work in 15 days.

$$\text{B's 1 day work} = \frac{1}{15}$$

$$(\text{A} + \text{B})\text{'s 1 day work} = \frac{1}{10} + \frac{1}{15} = \frac{5}{30} = \frac{1}{6}$$

A and B together will take 6 days to complete the work.

Q2.

Answer :

(c) $7\frac{1}{2}$ days

A man can do a work in 5 days.

$$\text{The man's 1 day work} = \frac{1}{5}$$

The man and the son can do the work in 3 days.

$$\text{The man and his son's 1 day work} = \frac{1}{3}$$

Let the son's 1 day work be $\frac{1}{x}$.

Therefore,

$$\frac{1}{3} = \frac{1}{5} + \frac{1}{x}$$

$$\text{or, } \frac{1}{x} = \frac{1}{3} - \frac{1}{5} = \frac{5-3}{15} = \frac{2}{15}$$

$$x = \frac{15}{2} = 7\frac{1}{2} \text{ days}$$

Q3.

Answer :

(d) 48 days

A can do a job in 16 days.

B can do the job in 12 days.

Suppose C can do the job in x days.

$$\text{A's 1 day work} = \frac{1}{16}$$

$$\text{B's 1 day work} = \frac{1}{12}$$

$$\text{C's 1 day work} = \frac{1}{x}$$

A, B and C together can complete the work in 6 days.

$$(\text{A} + \text{B} + \text{C})\text{'s 1 day work} = \frac{1}{6}$$

$$\text{Therefore, } \frac{1}{6} = \frac{1}{16} + \frac{1}{12} + \frac{1}{x}$$

$$\Rightarrow \frac{1}{x} = \frac{1}{6} - \frac{1}{10} - \frac{1}{12} = \frac{8-3-4}{48} = \frac{1}{48}$$

$$x = 48$$

Therefore, C alone can complete the job in 48 days.

Q4.

Answer :

(a) 30 days

Let B take x days to complete the work.

Then A takes $\left(x + \frac{50}{100}x\right) = 1.5x$

$$A's \text{ 1 day's work} = \frac{1}{1.5x} = \frac{2}{3x}$$

$$B's \text{ 1 day's work} = \frac{1}{x}$$

$(A + B)$ takes 18 days to complete the work.

$$(A + B)'s \text{ 1 day's net work} = \frac{1}{18}$$

$$\text{or } \frac{1}{18} = \frac{2}{3x} + \frac{1}{x}$$

$$\Rightarrow \frac{1}{18} = \frac{5}{3x}$$

By cross – multiplication, we get :

$$x = 30 \text{ days}$$

\therefore B alone will take 30 days to complete the work.

Q5.

Answer :

(c) 36 days

Let A take x days to complete the work. Then B takes $2x$ days to complete the work.

$$A's \text{ 1 day's work} = \frac{1}{x}$$

$$B's \text{ 1 day's work} = \frac{1}{2x}$$

A and B take 12 days to complete the work.

$$\text{Net work done by } (A + B) \text{ in 1 day} = \frac{1}{12} = \frac{1}{x} + \frac{1}{2x} = \frac{3}{2x}$$

$$\Rightarrow 2x = 36$$

$$\Rightarrow x = 18$$

A can complete the work by himself in 18 days.

B will take 36 days, i.e., twice as long as the time taken by A.

***** END *****
