

Exercise 2C

Question 11:

$$\text{Let } f(x) = (x^4 - 2x^3 + 3x^2 - ax + b)$$

\therefore From the given information,

$$f(1) = 1^4 - 2(1)^3 + 3(1)^2 - a(1) + b = 5$$

$$\Rightarrow 1 - 2 + 3 - a + b = 5$$

$$\Rightarrow 2 - a + b = 5 \dots(i)$$

And,

$$f(-1) = (-1)^4 - 2(-1)^3 + 3(-1)^2 - a(-1) + b = 19$$

$$\Rightarrow 1 + 2 + 3 + a + b = 19$$

$$\Rightarrow 6 + a + b = 19 \dots(ii)$$

Adding (i) and (ii), we get

$$\Rightarrow 8 + 2b = 24$$

$$\Rightarrow 2b = 24 - 8 = 16$$

$$\Rightarrow b = 16/2 = 8$$

Substituting the value of $b = 8$ in (i), we get

$$2 - a + 8 = 5$$

$$\Rightarrow -a + 10 = 5$$

$$\Rightarrow -a = -10 + 5$$

$$\Rightarrow -a = -5$$

$$\Rightarrow a = 5$$

$$\therefore a = 5 \text{ and } b = 8$$

$$f(x) = x^4 - 2x^3 + 3x^2 - ax + b$$

$$= x^4 - 2x^3 + 3x^2 - 5x + 8$$

$$\therefore f(2) = (2)^4 - 2(2)^3 + 3(2)^2 - 5(2) + 8$$

$$= 16 - 16 + 12 - 10 + 8$$

$$= 20 - 10 = 10$$

\therefore The required remainder is 10.
