

Congruent Triangles Ex 10.1 Q8

Answer :

It is given that

$$AB = AC$$

$$\angle ACD = 105^\circ$$

We have to find $\angle BAC$.

$$\angle C = \angle B \text{ (Isosceles triangle)}$$

Now

$$\angle B = 180^\circ - 105^\circ$$

Since exterior angle of isosceles triangle is the sum of two internal base angles

$$\angle B = 75^\circ$$

Now

$$\angle B = \angle C = 75^\circ$$

So, $\angle A + \angle B + \angle C = 180^\circ$ (By property of triangle)

$$\angle A + 75^\circ + 75^\circ = 180^\circ$$

$$\angle A = 180^\circ - 150^\circ$$

$$\angle A = 30^\circ$$

Hence $\boxed{\angle BAC = 30^\circ}$.

Congruent Triangles Ex 10.1 Q9

Answer :

We have to find the measure of each exterior angle of an equilateral triangle.

It is given that the triangle is equilateral

So, $AB = BC = AC$ and

$$\angle A = \angle B = \angle C$$

Since triangle is equilateral

So,

$$\angle A = 60^{\circ}$$

$$\angle B = 60^{\circ}$$

$$\angle C = 60^{\circ}$$

Now we have to find the exterior angle.

As we know that exterior angle of the triangle is sum of two interior angles

Thus

$$\text{exterior angle} = 60^{\circ} + 60^{\circ}$$

$$= 120^{\circ}$$

Hence each exterior angle is $\boxed{120^{\circ}}$.
