

Measurement Of Angles Ex 4.1 Q11

Let AB be the rail road

$$\angle AOB = 25^\circ = 25 \times \frac{\pi}{180} = \left(\frac{5\pi}{36}\right)^c \quad \left[\because 1^\circ = \left(\frac{\pi}{180}\right)^c \right]$$

We know that

$$\theta = \frac{\text{arc}}{\text{radius}}$$

$$\Rightarrow \angle AOB = \frac{AB}{OA}$$

$$\Rightarrow \frac{5\pi}{36} = \frac{40}{r}$$

$$\Rightarrow r = \frac{40 \times 36}{5\pi}$$

$$\Rightarrow r = \frac{288}{\pi} \text{ meter}$$

$$\Rightarrow r = 91.64 \text{ meter}$$

$$\left[\because \pi = \frac{22}{7} \right]$$

Measurement Of Angles Ex 4.1 Q12

Let, $\angle AOB = \theta = 1'$

$$AB = \text{arc } AB = l$$

$$OA = OB = r = 5280 \text{ m}$$

$$\therefore 1^\circ = 60'$$

$$\Rightarrow 1' = \left(\frac{1}{60}\right)^\circ = \left(\frac{1}{60} \times \frac{\pi}{180}\right)^c \quad \left[\because 1^\circ = \left(\frac{\pi}{180}\right)^c \right]$$

Now,

We know that

$$\theta = \frac{\text{arc}}{\text{radius}}$$

$$\Rightarrow \left(\frac{\pi}{180 \times 60}\right)^c = \frac{l}{5280}$$

$$\Rightarrow l = \frac{5280\pi}{180 \times 60} = 1.5365 \text{ m} \quad \left[\because \pi = \frac{22}{7} \right]$$

Measurement Of Angles Ex 4.1 Q13

Since A wheel makes 360 revolution in 1 minutes

\therefore Wheel will make $\frac{360}{60}$ revolution in 1 seconds

That is, 6 revolutin in1 second

Now,

In one revolutin the wheel makes 360° angle

\therefore In 6 revolution the wheel will make $360^\circ \times 6$ angles

$$= 2160^\circ$$

$$\therefore 1^\circ = \left(\frac{\pi}{180}\right)^c$$

$$\therefore 2160^\circ = \left(\frac{2160}{180} \times \pi\right)^c$$

$$= 12\pi$$

Measurement Of Angles Ex 4.1 Q14

(i) We have,

$$OA = \text{length of pendulum} = 75 \text{ cm} \\ = 0.75 \text{ m}$$

$$AB = \text{arc } AB = 10 \text{ cm} \\ = 0.1 \text{ m}$$

Also,

$$\theta = \frac{\text{arc}}{\text{radius}} \quad \text{---(i)}$$

$$\Rightarrow \theta = \frac{0.1}{0.75} = \left(\frac{2}{15}\right)^c$$

$$\theta = \frac{2}{15} \text{ radian}$$

(ii)

$$OA = 75 \text{ cm} = 0.75 \text{ m}$$

$$AB = 15 \text{ cm} = 0.15 \text{ m}$$

From (A)

$$\theta = \frac{0.15}{0.75} = \frac{1}{5} \text{ radian}$$

$$\theta = \frac{1}{5} \text{ radian}$$

(iii)

$$OA = 75 \text{ cm} = 0.75 \text{ m}$$

$$AB = 21 \text{ cm} = 0.21 \text{ m}$$

From (A)

$$\theta = \frac{0.21}{0.75} = \frac{7}{25}$$

$$\therefore \theta = \frac{7}{25} \text{ radian}$$

Measurement Of Angles Ex 4.1 Q15

We have,

$$OA = OB = \text{radius of circle} = 30 \text{ cm} = 0.3 \text{ m}$$

$$AB = \text{chord } AB = 30 \text{ cm} = 0.3 \text{ m}$$

$$\text{Arc } AB = \widehat{AB} = l \text{ (say)}$$

Now,

$$\triangle AOB \text{ is equilateral triangle as } OA = OB = AB = 30 \text{ cm}$$

$$\therefore \angle AOB = 60^\circ = \frac{\pi}{3} \text{ radian.}$$

$$\therefore \theta = \frac{\text{arc}}{\text{radius}}$$

$$\Rightarrow \frac{\pi}{3} = \frac{l}{0.3}$$

$$\Rightarrow l = \frac{0.3}{3} \pi = 0.1\pi \text{ m}$$

$$\therefore l = \text{arc } AB = 10\pi \text{ cm.}$$

***** END *****
