

Exercise 20A

$$\text{External volume of the box} = 60 \times 45 \times 32 = 86400 \text{ cm}^3$$

$$\text{Thickness of wood} = 2.5 \text{ cm}$$

$$\therefore \text{Internal length} = 60 - (2.5 \times 2) = 55 \text{ cm}$$

$$\text{Internal width} = 45 - (2.5 \times 2) = 40 \text{ cm}$$

$$\text{Internal height} = 32 - (2.5 \times 2) = 27 \text{ cm}$$

$$\text{Internal volume of the box} = 55 \times 40 \times 27 = 59400 \text{ cm}^3$$

$$\text{Volume of wood} = \text{External volume} - \text{Internal volume} = 86400 - 59400 = 27000 \text{ cm}^3$$

Q21.

Answer :

$$\text{External length} = 36 \text{ cm}$$

$$\text{External width} = 25 \text{ cm}$$

$$\text{External height} = 16.5 \text{ cm}$$

$$\text{External volume of the box} = 36 \times 25 \times 16.5 = 14850 \text{ cm}^3$$

$$\text{Thickness of iron} = 1.5 \text{ cm}$$

$$\therefore \text{Internal length} = 36 - (1.5 \times 2) = 33 \text{ cm}$$

$$\text{Internal width} = 25 - (1.5 \times 2) = 22 \text{ cm}$$

$$\text{Internal height} = 16.5 - 1.5 = 15 \text{ cm (as the box is open)}$$

$$\text{Internal volume of the box} = 33 \times 22 \times 15 = 10890 \text{ cm}^3$$

$$\text{Volume of iron} = \text{External volume} - \text{Internal volume} = 14850 - 10890 = 3960 \text{ cm}^3$$

Given:

$$1 \text{ cm}^3 \text{ of iron} = 8.5 \text{ grams}$$

$$\text{Total weight of the box} = 3960 \times 8.5 = 33660 \text{ grams} = 33.66 \text{ kilograms}$$

Q22.

Answer :

$$\text{External length} = 56 \text{ cm}$$

$$\text{External width} = 39 \text{ cm}$$

$$\text{External height} = 30 \text{ cm}$$

$$\text{External volume of the box} = 56 \times 39 \times 30 = 65520 \text{ cm}^3$$

Thickness of wood = 3 cm

$$\therefore \text{Internal length} = 56 - (3 \times 2) = 50 \text{ cm}$$

$$\text{Internal width} = 39 - (3 \times 2) = 33 \text{ cm}$$

$$\text{Internal height} = 30 - (3 \times 2) = 24 \text{ cm}$$

$$\text{Capacity of the box} = \text{Internal volume of the box} = 50 \times 33 \times 24 = 39600 \text{ cm}^3$$

$$\text{Volume of wood} = \text{External volume} - \text{Internal volume} = 65520 - 39600 = 25920 \text{ cm}^3$$

Q23.

Answer :

External length = 62 cm

External width = 30 cm

External height = 18 cm

$$\therefore \text{External volume of the box} = 62 \times 30 \times 18 = 33480 \text{ cm}^3$$

Thickness of the wood = 2 cm

$$\text{Now, internal length} = 62 - (2 \times 2) = 58 \text{ cm}$$

$$\text{Internal width} = 30 - (2 \times 2) = 26 \text{ cm}$$

$$\text{Internal height} = 18 - (2 \times 2) = 14 \text{ cm}$$

$$\therefore \text{Capacity of the box} = \text{internal volume of the box} = (58 \times 26 \times 14) \text{ cm}^3 = 21112 \text{ cm}^3$$

Q24.

Answer :

External length = 80 cm

External width = 65 cm

External height = 45 cm

$$\therefore \text{External volume of the box} = 80 \times 65 \times 45 = 234000 \text{ cm}^3$$

Thickness of the wood = 2.5 cm

$$\text{Then internal length} = 80 - (2.5 \times 2) = 75 \text{ cm}$$

$$\text{Internal width} = 65 - (2.5 \times 2) = 60 \text{ cm}$$

$$\text{Internal height} = 45 - (2.5 \times 2) = 40 \text{ cm}$$

$$\text{Capacity of the box} = \text{internal volume of the box} = (75 \times 60 \times 40) \text{ cm}^3 = 180000 \text{ cm}^3$$

$$\text{Volume of the wood} = \text{external volume} - \text{internal volume} = (234000 - 180000) \text{ cm}^3 = 54000 \text{ cm}^3$$

It is given that 100 cm^3 of wood weighs 8 g.

$$\therefore \text{Weight of the wood} = \frac{54000}{100} \times 8 \text{ g} = 4320 \text{ g} = 4.32 \text{ kg}$$

Q25.

Answer :

(i) Length of the edge of the cube = $a = 7$ m

Now, we have the following:

$$\text{Volume} = a^3 = 7^3 = 343 \text{ m}^3$$

$$\text{Lateral surface area} = 4a^2 = 4 \times 7 \times 7 = 196 \text{ m}^2$$

$$\text{Total Surface area} = 6a^2 = 6 \times 7 \times 7 = 294 \text{ m}^2$$

(ii) Length of the edge of the cube = $a = 5.6$ cm

Now, we have the following:

$$\text{Volume} = a^3 = 5.6^3 = 175.616 \text{ cm}^3$$

$$\text{Lateral surface area} = 4a^2 = 4 \times 5.6 \times 5.6 = 125.44 \text{ cm}^2$$

$$\text{Total Surface area} = 6a^2 = 6 \times 5.6 \times 5.6 = 188.16 \text{ cm}^2$$

(iii) Length of the edge of the cube = $a = 8 \text{ dm } 5 \text{ cm} = 85 \text{ cm}$

Now, we have the following:

$$\text{Volume} = a^3 = 85^3 = 614125 \text{ cm}^3$$

$$\text{Lateral surface area} = 4a^2 = 4 \times 85 \times 85 = 28900 \text{ cm}^2$$

$$\text{Total Surface area} = 6a^2 = 6 \times 85 \times 85 = 43350 \text{ cm}^2$$

Q26.

Answer :

Let a be the length of the edge of the cube.

$$\text{Total surface area} = 6a^2 = 1176 \text{ cm}^2$$

$$\Rightarrow a = \sqrt{\frac{1176}{6}} = \sqrt{196} = 14 \text{ cm}$$

$$\therefore \text{Volume} = a^3 = 14^3 = 2744 \text{ cm}^3$$

Q27.

Answer :

Let a be the length of the edge of the cube.

$$\text{Then volume} = a^3 = 729 \text{ cm}^3$$

$$\text{Also, } a = \sqrt[3]{729} = 9 \text{ cm}$$

$$\therefore \text{Surface area} = 6a^2 = 6 \times 9 \times 9 = 486 \text{ cm}^2$$

Q28.

Answer :

$$1 \text{ m} = 100 \text{ cm}$$

$$\text{Volume of the original block} = 225 \times 150 \times 27 = 911250 \text{ cm}^3$$

Length of the edge of one cube = 45 cm

Then volume of one cube = $45^3 = 91125 \text{ cm}^3$

$$\therefore \text{Total number of blocks that can be cast} = \frac{\text{volume of the block}}{\text{volume of one cube}} = \frac{911250}{91125} = 10$$

Q29.

Answer :

Let a be the length of the edge of a cube.

Volume of the cube = a^3

Total surface area = $6a^2$

If the length is doubled, then the new length becomes $2a$.

Now, new volume = $(2a)^3 = 8a^3$

Also, new surface area = $6(2a)^2 = 6 \times 4a^2 = 24a^2$

\therefore The volume is increased by a factor of 8, while the surface area increases by a factor of 4.

Q30.

Answer :

Cost of wood = Rs 500/ m^3

Cost of the given block = Rs 256

$$\therefore \text{Volume of the given block} = a^3 = \frac{256}{500} = 0.512 \text{ m}^3 = 512000 \text{ cm}^3$$

Also, length of its edge = $a = \sqrt[3]{0.512} = 0.8 \text{ m} = 80 \text{ cm}$

***** END *****
