

Exercise 11B

Question 2:

(i)

The angle subtended by an arc of a circle at the centre is double the angle subtended by the arc at any point on the circumference.

$$\therefore \angle AOB = 2\angle OCA$$

$$\Rightarrow \angle OCA = \frac{70}{2} = 35^\circ \quad [\because \angle AOB = 70^\circ]$$

(ii) The radius of the circle is

$$OA = OC$$

$$\Rightarrow \angle OAC = \angle OCA \quad [\text{base angles of an isosceles triangle are equal}]$$

$$\Rightarrow \angle OAC = 35^\circ \quad [\text{as } \angle OCA = 35^\circ]$$

Question 3:

It is clear that $\angle ACB = \angle PCB$

Consider the triangle $\triangle PCB$.

Applying the angle sum property, we have,

$$\angle PCB = 180^\circ - (\angle BPC + \angle PBC)$$

$$= 180^\circ - (180^\circ - 110^\circ + 25^\circ) \quad [\angle APB \text{ and } \angle BPC \text{ are linear pair; } \angle PBC = 25^\circ, \text{ given}]$$

$$= 180^\circ - (70^\circ + 25^\circ)$$

$$\angle PCB = 180^\circ - 95^\circ = 85^\circ$$

Angles in the same segment of a circle are equal.

$$\therefore \angle ADB = \angle ACB = 85^\circ$$

***** END *****
