

Page 162

Solution 1

The commercial unit of energy is kilowatt-hour.

Solution 2

One kilowatt-hour is the amount of electrical energy consumed when an electrical appliance having power of 1 kilowatt is used for 1 hour.

Solution 3

Megawatt and kilowatt are the units of power bigger than watt.

Solution 4

1 watt is the power of an appliance which does work at the rate of 1 joule per second.

Solution 5

1 horse power = 746 watt

Solution 6

Power has watt as its physical unit

Solution 7

1 watt

Solution 8

Work done = 1200 J

Time taken = 2 minutes = 2 x 60 = 120 s

Work done = 1200 J

Time taken = 2 minutes = 2 x 60 = 120 s

$$\text{Power} = \frac{\text{Work done}}{\text{time taken}} = \frac{1200}{120} = 10 \text{ W}$$

Solution 9

One kilowatt =  $3.6 \times 10^6$  J

Solution 10

a) Power

b) Electrical Energy

Solution 11

1 kW-h of electrical energy is commonly known as unit of electricity.

Solution 12

A cell converts chemical energy into electrical energy.

Solution 13

Electric motor

Solution 14

a) Electric generator

b) Cell

c) Electric iron

d) Solar cell

e) Electric bulb

Solution 15

a) Speaker

b) Steam engine

c) Car engine

d) Gas stove

e) Solar water heater

Solution 16

a) Work

- b) Joule ; second
- c) kWh
- d) conservation; transformed; created; destroyed
- e) kinetic; potential

Page 163

Solution 17

Force,  $F = 400 \text{ N}$

Distance,  $s = 60 \text{ m}$

Time taken,  $t = 1 \text{ minute} = 60 \text{ s}$

Work done,  $W = F \times s = 400 \times 60$

$$\begin{aligned} &\text{Force, } F = 400 \text{ N} \\ &\text{Distance, } s = 60 \text{ m} \\ &\text{Time taken, } t = 1 \text{ minute} = 60 \text{ s} \\ &\text{Work done, } W = F \times s = 400 \times 60 \\ &\text{Power} = \frac{\text{Work done}}{\text{time taken}} = \frac{400 \times 60}{60} = 400 \text{ W} \end{aligned}$$

Solution 18

At a hydroelectric power station, the potential energy of water is transformed into kinetic energy and then into electrical energy.

Solution 19

At a coal-based thermal power station, the chemical energy of coal is transformed into heat energy, which is further converted into kinetic energy and electrical energy.

Solution 20

Weight of the man = 500 N

Weight of the load = 100 N

Total weight = 600 N

Height of stairs = 4 m

Time taken = 5 s

Work done =  $mg \times h = \text{weight} \times h = 600 \times 4$

$$\begin{aligned} &\text{Weight of the man} = 500 \text{ N} \\ &\text{Weight of the load} = 100 \text{ N} \\ &\text{Total weight} = 600 \text{ N} \\ &\text{Height of stairs} = 4 \text{ m} \\ &\text{Time taken} = 5 \text{ s} \\ &\text{Work done} = mg \times h = \text{weight} \times h = 600 \times 4 \end{aligned}$$

$$\text{Power} = \frac{\text{Work done}}{\text{time taken}} = \frac{600 \times 4}{5} = 480 \text{ W}$$

Solution 21

Power = 3 kW

Time = 20 s

$$\begin{aligned} &\text{Power} = 3 \text{ kW} \\ &\text{Time} = 20 \text{ s} \\ &\text{Power} = \frac{\text{work done}}{\text{time}} \\ &\text{Work done} = \text{power} \times \text{time} = 3 \times 20 \text{ kW} = 60 \text{ kJ} \end{aligned}$$

Work done = power x time = 3 x 20 kW = 60 kJ

Solution 22

Energy consumed = 600 kJ

Time taken = 5 minutes = 300 s

Energy consumed = 600 kJ

Time taken = 5 minutes = 300 s

$$\text{Power} = \frac{\text{energy}}{\text{time}} = \frac{600}{300} = 2 \text{ kW}$$

Solution 23

Power = 100 W

a) time = 1 s

energy = power x time = 100 J

b) time = 1 minute = 60 s

energy = power x time = 100 x 60 = 6 kJ

Solution 24

Power of 1 fan = 120 W

Power of 5 fans = 5 x 120 = 600 W = 0.6 kW

Time = 4 hours

Electrical energy = 0.6 x 4 = 2.4 kWh

Solution 25

A radio first converts electrical energy into kinetic energy and then into sound energy

Solution 26

In an electric bulb, electrical energy is first converted into heat energy and then into light energy

Solution 27

Fan, washing machine, mixer grinder, water pump, hair dryer use electric motor

Solution 28

i) chemical energy to electrical energy

ii) electrical energy to heat and light energy

Solution 29

i) Maximum potential energy is present in the bob at point C as at point C bob is at maximum height.

ii) Maximum kinetic energy is present in the bob at point A as at point A bob is at maximum speed

Solution 30

Weight of the car = 20000 N = 20 kN

Speed = 8 m/s

Distance s = 120 m

Time = 100 s

a) Work done  $W = f \times s = 20 \times 120 = 2400 \text{ kJ}$

b) Power

Weight of the car = 20000 N = 20 kN

Speed = 8 m/s

Distance s = 120 m

Time = 100 s

a) Work done  $W = f \times s = 20 \times 120 = 2400 \text{ kJ}$

$$\text{b) Power} = \frac{\text{work done}}{\text{time}} = \frac{2400}{100} = 24 \text{ kW}$$

Solution 31

a) The change of one form of energy into another form of energy is known as transformation of energy, e.g. in a cell chemical energy is transformed into electrical energy

b) a. When a ball is thrown upwards its kinetic energy gradually converts into potential energy and potential energy becomes maximum at the maximum height attained by the ball

b. When a stone is dropped from the roof of the building its potential energy gradually converts into kinetic energy and kinetic energy becomes maximum when the stone is just above the ground  
Solution 32

a) Law of conservation of energy states that whenever energy changes from one form to another form, the total amount of energy remains constant. Energy can never be created nor destroyed, it transforms from one form to another. For example, when electrical energy is converted into light energy in an electric bulb, then some energy is wasted as heat during conversion but the total energy remains the same.

b) Initially the pendulum is at rest. The bob is pulled to one side to position B to give it potential energy due to higher position of B and then released, the bob starts swinging

i. When the bob is at position B, it has potential energy but no kinetic energy

ii. As the bob starts moving down from position B to A, its potential energy starts decreasing and kinetic energy starts increasing

iii. When the bob is at position A, it has maximum kinetic energy and zero potential energy

iv. As the bob starts moving down from position A to C, its kinetic energy starts decreasing and potential energy starts increasing

v. On reaching the extreme position C, the bob stops for a very small instant of time and bob maximum potential energy and zero kinetic energy.

Therefore at extreme positions B and C bob has only potential energy and at A it has only kinetic energy and at other intermediate positions bob has both kinetic and potential energy. Thus the total energy of the pendulum is same for any instant of time (conserved)

Solution 33

a) The unit kWh stands for kilowatt-hour. One kilowatt-hour is the amount of electrical energy consumed when an electrical appliance having power of 1 kilowatt is used for 1 hour. It represents the amount of electrical energy consumed in 1 hour.

b) Power = 1000 W = 1 kW

Time = 60 minutes = 1 hour

Energy(kWh) = 1 x 1 = 1 kWh

Solution 34

a) 1 kilowatt-hour = 1 kW for 1 hour = 1000 W for 1 hour

a) 1 kilowatt-hour = 1 kW for 1 hour

= 1000 W for 1 hour

But 1 watt =  $\frac{1 \text{ joule}}{1 \text{ second}}$

1 kilowatt- hour =  $\frac{1000 \text{ joule}}{1 \text{ second}}$  for 1 hour

=  $1000 \frac{\text{joule}}{\text{second}}$  for 3600 seconds

=  $1000 \times 3600 = 3.6 \times 10^6 \text{ joule}$

b) Energy consumption = 650 units = 650 kWh

1 kWh =  $3.6 \times 10^6 \text{ J}$

650 kWh =  $3.6 \times 650 \times 10^6 = 2.34 \times 10^9 \text{ J}$

Solution 35

a) Power is the rate of doing work.

a) Power is the rate of doing work.

Power =  $\frac{\text{work done}}{\text{time}}$

SI unit of power is watt(W)

b) Mass of the boy = 40 kg

Mass of the box = 20 kg

Total mass = 60 kg

Height h= 15 m

$g = 10 \text{ m/s}^2$

time taken = 25 s

work done =  $m \times g \times h = 60 \times 15 \times 10 = 9000 \text{ J}$

Power =  $\frac{\text{work done}}{\text{time}} = \frac{9000}{25} = 360 \text{ W}$

\*\*\*\*\* END \*\*\*\*\*
