NCERT MISCELLANEOUS SOLUTIONS

Question-1

The relation f is defined by $f(x)=\begin{cases} x^2, & 0 \le x \le 3 \\ 3x, & 3 \le x \le 10 \end{cases}$

The relation g is defined by $g(x)=\begin{cases} x^2, & 0 \le x \le 2 \\ 3x, & 2 \le x \le 10 \end{cases}$

Show that f is a function and g is not a function

Ans.

The relation f is defined as $f(x)=\begin{cases} x^2, & 0 \le x \le 3 \\ 3x, & 3 \le x \le 10 \end{cases}$

It is observed that for

$0 \le x < 3, f(x) = x^2$

$3 < x \le 10, f(x) = 3x$

Also, at $x = 3, f(x) = 3^2 = 9$ or $f(x) = 3 \times 3 = 9$

i.e., at $x = 3, f(x) = 9$

Therefore, for $0 \le x \le 10$, the images of $f(x)$ are unique.

Thus, the given relation is a function.

The relation g is defined as $g(x)=\begin{cases} x^2, & 0 \le x \le 2 \\ 3x, & 2 \le x \le 10 \end{cases}$

It can be observed that for $x = 2$, $g(x) = 2^2 = 4$ and $g(x) = 3 \times 2 = 6$

Hence, element 2 of the domain of the relation g corresponds to two different images i.e., 4 and 6. Hence, this relation is not a function.

Question-2

If $f(x) = x^2$, find $\dfrac{f(1.1)-f(1)}{(1.1-1)}$

Ans.

$$f(x)=x^2$$

$$\therefore \frac{f(1.1)-f(1)}{(1.1-1)}=\frac{(1.1)^2-(1)^2}{(1.1-1)}=\frac{1.21-1}{0.1}=\frac{0.21}{0.1}=2.1$$

Question-3

Find the domain of the function $f(x)=\dfrac{x^2+2x+1}{x^2-8x+12}$

Ans.

The given function is $f(x)=\dfrac{x^2+2x+1}{x^2-8x+12}$.

$$f(x)=\frac{x^2+2x+1}{x^2-8x+12}=\frac{x^2+2x+1}{(x-6)(x-2)}$$

It can be seen that function *f* is defined for all real numbers except at $x = 6$ and $x = 2$.

Hence, the domain of *f* is $\mathbf{R} - \{2, 6\}$.

Question-4

Find the domain and the range of the real function *f* defined by $f(x)=\sqrt{(x-1)}$.

Ans.

The given real function is $f(x)=\sqrt{x-1}$.

It can be seen that $\sqrt{x-1}$ is defined for $(x - 1) \geq 0$.

i.e., $f(x)=\sqrt{(x-1)}$ is defined for $x \geq 1$.

Therefore, the domain of *f* is the set of all real numbers greater than or equal to 1 i.e., the domain of $f = [1, \infty)$.

As $x \geq 1 \Rightarrow (x - 1) \geq 0 \Rightarrow \sqrt{x-1} \geq 0$

Therefore, the range of *f* is the set of all real numbers greater than or equal to 0 i.e., the range of $f = [0, \infty)$.

Question-5

Find the domain and the range of the real function *f* defined by $f(x) = |x - 1|$.

Ans.

The given real function is $f(x) = |x - 1|$.

It is clear that $|x - 1|$ is defined for all real numbers.

$\therefore$ Domain of $f = \mathbf{R}$

Also, for $x \in \mathbf{R}$, $|x - 1|$ assumes all real numbers.

Hence, the range of *f* is the set of all non-negative real numbers

Question-6

Let $f=\left\{\left(x, \dfrac{x^2}{1+x^2}\right): x \in \mathbf{R}\right\}$ be a function from **R** into **R**. Determine the range of *f*.

Ans.

Let $f=\left\{\left(x, \dfrac{x^2}{1+x^2}\right): x \in \mathbf{R}\right\}$ be a function from **R** into **R**. Determine the range of *f*.

Question-7

Let f, g: **R** → **R** be defined, respectively by $f(x) = x + 1$, $g(x) = 2x - 3$. Find $f + g$, $f - g$ and $\frac{f}{g}$.

Ans.

$f, g: \mathbf{R} \to \mathbf{R}$ is defined as $f(x) = x + 1$, $g(x) = 2x - 3$

$(f + g)(x) = f(x) + g(x) = (x + 1) + (2x - 3) = 3x - 2$

$\therefore (f + g)(x) = 3x - 2$

$(f - g)(x) = f(x) - g(x) = (x + 1) - (2x - 3) = x + 1 - 2x + 3 = -x + 4$

$\therefore (f - g)(x) = -x + 4$

$$\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)},\ g(x) \neq 0,\ x \in \mathbf{R}$$

$$\therefore \left(\frac{f}{g}\right)(x) = \frac{x+1}{2x-3},\ 2x - 3 \neq 0 \text{ or } 2x \neq 3$$

$$\therefore \left(\frac{f}{g}\right)(x) = \frac{x+1}{2x-3},\ x \neq \frac{3}{2}$$

Question-8

Let $f = \{(1, 1), (2, 3), (0, -1), (-1, -3)\}$ be a function from **Z** to **Z** defined by $f(x) = ax + b$, for some integers a, b. Determine a, b.

Ans.

$f = \{(1, 1), (2, 3), (0, -1), (-1, -3)\}$

$f(x) = ax + b$

$(1, 1) \in f$

$\Rightarrow f(1) = 1$

$\Rightarrow a \times 1 + b = 1$

$\Rightarrow a + b = 1$

$(0, -1) \in f$

$\Rightarrow f(0) = -1$

$\Rightarrow a \times 0 + b = -1$

$\Rightarrow b = -1$

On substituting $b = -1$ in $a + b = 1$, we obtain $a + (-1) = 1 \Rightarrow a = 1 + 1 = 2$.

Thus, the respective values of a and b are 2 and -1.

Question-9

Let R be a relation from **N** to **N** defined by R = $\{(a, b): a, b \in \mathbf{N} \text{ and } a = b^2\}$. Are the following true?

(i) $(a, a) \in$ R, for all $a \in$ **N** (ii) $(a, b) \in$ R, implies $(b, a) \in$ R

(iii) $(a, b) \in$ R, $(b, c) \in$ R implies $(a, c) \in$ R.

Justify your answer in each case.

Ans.

$R = \{(a, b): a, b \in \mathbf{N} \text{ and } a = b^2\}$

(i) It can be seen that $2 \in \mathbf{N}$;however, $2 \neq 2^2 = 4$.

Therefore, the statement "$(a, a) \in R$, for all $a \in \mathbf{N}$" is not true.

(ii) It can be seen that $(9, 3) \in \mathbf{N}$ because $9, 3 \in \mathbf{N}$ and $9 = 3^2$.

Now, $3 \neq 9^2 = 81$; therefore, $(3, 9) \notin \mathbf{N}$

Therefore, the statement "$(a, b) \in R$, implies $(b, a) \in R$" is not true.

(iii) It can be seen that $(9, 3) \in R$, $(16, 4) \in R$ because $9, 3, 16, 4 \in \mathbf{N}$ and $9 = 3^2$ and $16 = 4^2$.

Now, $9 \neq 4^2 = 16$; therefore, $(9, 4) \notin \mathbf{N}$

Therefore, the statement "$(a, b) \in R$, $(b, c) \in R$ implies $(a, c) \in R$" is not true

Question-10

Let $A = \{1, 2, 3, 4\}$, $B = \{1, 5, 9, 11, 15, 16\}$ and $f = \{(1, 5), (2, 9), (3, 1), (4, 5), (2, 11)\}$. Are the following true?

(i) f is a relation from A to B (ii) f is a function from A to B.

Justify your answer in each case

Ans.

$A = \{1, 2, 3, 4\}$ and $B = \{1, 5, 9, 11, 15, 16\}$

$\therefore A \times B = \{(1, 1), (1, 5), (1, 9), (1, 11), (1, 15), (1, 16), (2, 1), (2, 5), (2, 9), (2, 11), (2, 15), (2, 16), (3, 1), (3, 5), (3, 9), (3, 11), (3, 15), (3, 16), (4, 1), (4, 5), (4, 9), (4, 11), (4, 15), (4, 16)\}$

It is given that $f = \{(1, 5), (2, 9), (3, 1), (4, 5), (2, 11)\}$

(i) A relation from a non-empty set A to a non-empty set B is a subset of the Cartesian product $A \times B$.

It is observed that f is a subset of $A \times B$.

Thus, f is a relation from A to B.

(ii) Since the same first element i.e., 2 corresponds to two different images i.e., 9 and 11, relation f is not a function.

Question-11

Let f be the subset of $\mathbf{Z} \times \mathbf{Z}$ defined by $f = \{(ab, a + b): a, b \in \mathbf{Z}\}$. Is f a function from $\mathbf{Z}$ to $\mathbf{Z}$: justify your answer

Ans.

The relation f is defined as $f = \{(ab, a + b): a, b \in \mathbf{Z}\}$

We know that a relation f from a set A to a set B is said to be a function if every element of set A has unique images in set B.

Since $2, 6, -2, -6 \in \mathbf{Z}$, $(2 \times 6, 2 + 6), (-2 \times -6, -2 + (-6)) \in f$

i.e., $(12, 8), (12, -8) \in f$

It can be seen that the same first element i.e., 12 corresponds to two different images i.e., 8 and -8. Thus, relation f is not a function.

Question-12

Let $A = \{9, 10, 11, 12, 13\}$ and let $f: A \rightarrow \mathbf{N}$ be defined by $f(n)$ = the highest prime factor of n. Find the range of f.

Ans.

$A = \{9, 10, 11, 12, 13\}$

$f: A \to \mathbf{N}$ is defined as

$f(n)$ = The highest prime factor of n

Prime factor of 9 = 3

Prime factors of 10 = 2, 5

Prime factor of 11 = 11

Prime factors of 12 = 2, 3

Prime factor of 13 = 13

$\therefore f(9)$ = The highest prime factor of 9 = 3

$f(10)$ = The highest prime factor of 10 = 5

$f(11)$ = The highest prime factor of 11 = 11

$f(12)$ = The highest prime factor of 12 = 3

$f(13)$ = The highest prime factor of 13 = 13

The range of f is the set of all $f(n)$, where $n \in A$.

$\therefore$ Range of $f = \{3, 5, 11, 13\}$
