

## Indefinite Integrals Ex 19.19 Q5

Indefinite integrals EX 19.19 Q5

Let 
$$I = \int \frac{x^2}{x^2 + 7x + 10} dx$$

$$= \int \left\{ 1 - \frac{7x + 10}{x^2 + 7x + 10} \right\} dx$$

$$I = x - \int \frac{7x + 10}{x^2 + 7x + 10} dx + c_1 - - - - (i)$$

Let  $I_1 = \int \frac{7x + 10}{x^2 + 7x + 10} dx$ 

$$\text{Let } 7x + 10 = \lambda \frac{d}{dx} \left( x^2 + 7x + 10 \right) + \mu$$

$$= \lambda \left( 2x + 7 \right) + \mu$$

$$7x + 10 = \left( 2\lambda \right) x + 7\lambda + \mu$$
Comparing the coefficients of like powers of  $x$ ,
$$7 = 2\lambda \qquad \Rightarrow \qquad \lambda = \frac{7}{2}$$

$$7\lambda + \mu = 10 \qquad \Rightarrow \qquad 7\left( \frac{7}{2} \right) + \mu = 10$$

so, 
$$I = \int \frac{\frac{1}{6} \left\{ 6x - 4 \right\} - \frac{1}{3}}{3x^2 - 4x + 3} dx$$

$$I = \frac{1}{6} \int \frac{6x - 4}{3x^2 - 4x + 3} dx - \frac{1}{9} \int \frac{1}{x^2 - \frac{4}{3}x + 1} dx$$

$$I = \frac{1}{6} \int \frac{6x - 4}{3x^2 - 4x + 3} dx - \frac{1}{9} \int \frac{1}{x^2 - 2x \left(\frac{2}{3}\right) + \left(\frac{2}{3}\right)^2 - \left(\frac{2}{3}\right)^2 + \left(2\right)^2} dx$$

$$I = \frac{1}{6} \int \frac{6x - 4}{3x^2 - 4x + 3} dx - \frac{1}{9} \int \frac{1}{\left(x - \frac{2}{3}\right)^2 + \left(\frac{\sqrt{5}}{3}\right)^2} dx$$

$$= \frac{1}{6} \log \left| 3x^2 - 4x + 3 \right| - \frac{1}{9} \times \frac{1}{\left(\frac{\sqrt{5}}{3}\right)} \tan^{-1} \left(\frac{x - \frac{2}{3}}{3}\right) + c \quad \left[ \text{ since, } \int \frac{1}{a^2 + x^2} dx = \frac{1}{a} \tan^{-1} \left(\frac{x}{a}\right) + c \right]$$

$$I = \frac{1}{6} \log \left| 3x^2 - 4x + 3 \right| - \frac{\sqrt{5}}{15} \tan^{-1} \left(\frac{3x - 2}{\sqrt{5}}\right) + c$$

Indefinite Integrals Ex 19.19 Q6

We need to evaluate the integral  $\int \frac{2x}{2+x-x^2} dx$ 

write the numerator in the following form

$$2x = \lambda \left\{ \frac{d}{dx} \left( 2 + x - x^2 \right) \right\} + \mu$$

i.e. 
$$2x = \lambda(-2x+1) + \mu$$

Equating the coefficients will give the values of  $\lambda, \mu$  $\lambda = -1, \mu = 1$ 

$$\int \frac{2x}{2+x-x^2} dx = \int \frac{\lambda(-2x+1) + \mu}{2+x-x^2} dx$$

$$= \int \frac{-1(-2x+1) + 1}{2+x-x^2} dx$$

$$= \int \frac{-1(-2x+1)}{2+x-x^2} dx + \frac{1}{2+x-x^2} dx$$

$$= -1 \log |2+x-x^2| + \int \frac{1}{2+x-x^2} dx$$

$$= -1 \log |2+x-x^2| - \int \frac{1}{(x^2-x-2)} dx$$

$$= -\log \left| 2 + x - x^2 \right| - \int \frac{1}{\left( x^2 - x + \frac{1}{4} - 2 - \frac{1}{4} \right)} dx$$

$$= -\log \left| 2 + x - x^2 \right| - \int \frac{1}{\left( x^2 - x + \frac{1}{4} - \frac{9}{4} \right)} dx$$

$$= -\log \left| 2 + x - x^2 \right| - \int \frac{1}{\left( \left( x - \frac{1}{2} \right)^2 - \left( \frac{3}{2} \right)^2 \right)} dx$$

$$= -\log \left| 2 + x - x^2 \right| - \frac{1}{3} \log \left| \frac{\left( x - \frac{1}{2} \right) - \left( \frac{3}{2} \right)}{\left( x - \frac{1}{2} \right) + \left( \frac{3}{2} \right)} \right| + C$$

$$= -\log \left| 2 + x - x^2 \right| - \frac{1}{3} \log \left| \frac{\left( x - 2 \right)}{\left( x + 1 \right)} \right| + C$$

Indefinite Integrals Ex 19.19 Q7

Let 
$$I = \int \frac{1-3x}{3x^2+4x+2} dx$$
  
Let  $1-3x = \lambda \frac{d}{dx} \left(3x^2+4x+2\right) + \mu$   
 $= \lambda \left(6x+4\right) + \mu$   
 $1-3x = \left(6\lambda\right)x + \left(4\lambda + \mu\right)$   
Comparing the coefficients of like powers of  $x$ ,  
 $6\lambda = -3$   $\Rightarrow \lambda = -\frac{1}{2}$ 

$$6\lambda = -3 \qquad \Rightarrow \lambda = -\frac{1}{2}$$

$$4\lambda + \mu = 1 \qquad \Rightarrow \qquad 4\left(-\frac{1}{2}\right) + \mu = 1$$

$$\mu = 3$$

so, 
$$I = \int \frac{-\frac{1}{2} \left( 6x + 4 \right) + 3}{3x^2 + 4x + 2} dx$$

$$I = -\frac{1}{2} \int \frac{6x + 4}{3x^2 + 4x + 2} dx + 3 \int \frac{1}{3x^2 + 4x + 2} dx$$

$$I = -\frac{1}{2} \int \frac{6x + 4}{3x^2 + 4x + 2} dx + \frac{3}{3} \int \frac{1}{x^2 + \frac{4}{3}x + \frac{2}{3}} dx$$

$$I = -\frac{1}{2} \int \frac{6x + 4}{3x^2 + 4x + 2} dx + \int \frac{1}{x^2 + 2x \left(\frac{2}{3}\right) + \left(\frac{2}{3}\right)^2 - \left(\frac{2}{3}\right)^2 + \frac{2}{3}} dx$$

$$= -\frac{1}{2} \int \frac{6x + 4}{3x^2 + 4x + 2} dx + \int \frac{1}{\left(x + \frac{2}{3}\right)^2 + \frac{2}{9}} dx$$

$$I = -\frac{1}{2} \int \frac{6x + 4}{3x^2 + 4x + 2} dx + \int \frac{1}{\left(x + \frac{2}{3}\right)^2 + \left(\frac{\sqrt{2}}{3}\right)^2} dx$$

$$= -\frac{1}{2} \log \left| 3x^2 + 4x + 2 \right| + \frac{3}{\sqrt{2}} \tan^{-1} \left( \frac{x + \frac{2}{3}}{\sqrt{2}} \right) + c \qquad \left[ \text{ since, } \int \frac{1}{x^2 + a^2} dx = \frac{1}{a} \tan^{-1} \left( \frac{x}{a} \right) + c \right]$$

$$I = -\frac{1}{2} \log \left| 3x^2 + 4x + 2 \right| + \frac{3}{\sqrt{2}} \tan^{-1} \left( \frac{3x + 2}{\sqrt{2}} \right) + c$$

## Indefinite Integrals Ex 19.19 Q8

Let 
$$I = \int \frac{2x+5}{x^2-x-2} dx$$
  
Let  $2x+5 = \lambda \frac{d}{dx} \left( x^2-x-2 \right) + \mu$   
 $= \lambda \left( 2x-1 \right) + \mu$   
 $2x+5 = \left( 2\lambda \right) x - \lambda + \mu$   
Comparing the coefficients of like powers of x,  
 $2\lambda = 2$   $\Rightarrow \lambda = 1$ 

$$2\lambda = 2$$
  $\Rightarrow$   $\lambda = 1$   
 $-\lambda + \mu = 5$   $\Rightarrow$   $-1 + \mu = 5$   
 $\mu = 6$ 

so, 
$$I = \int \frac{(2x-1)+6}{x^2-x-2} dx$$

$$I = \int \frac{(2x-1)}{x^2-x-2} dx + 6\int \frac{1}{x^2-2x\left(\frac{1}{2}\right)+\left(\frac{1}{2}\right)^2-\left(\frac{1}{2}\right)^2-2} dx$$

$$I = \int \frac{2x-1}{x^2-x-2} dx + 6\int \frac{1}{\left(x-\frac{1}{2}\right)^2-\frac{9}{4}} dx$$

$$I = \int \frac{2x-1}{x^2-x-2} dx + 6\int \frac{1}{\left(x-\frac{1}{2}\right)^2-\left(\frac{3}{2}\right)^2} dx$$

$$I = \log \left|x^2-x-2\right| + \frac{6}{2\left(\frac{3}{2}\right)} \log \left|\frac{x-\frac{1}{2}-\frac{3}{2}}{x-\frac{1}{2}+\frac{3}{2}}\right| + c \qquad \left[\text{since, } \int \frac{1}{x^2-a^2} dx = \frac{1}{2a} \log \left|\frac{x-a}{x+a}\right| + c\right]$$

$$I = \log \left|x^2-x-2\right| + 2\log \left|\frac{x-2}{x+1}\right| + c$$

Indefinite Integrals Ex 19.19 Q9

Let 
$$I = \int \frac{ax^3 + bx}{x^4 + c^2} dx$$
  
Let  $ax^3 + bx = \lambda \frac{d}{dx} (x^4 + c^2) + \mu$   
 $ax^3 + bx = \lambda (4x^3) + \mu$ 

Comparing the coefficients of like powers (

$$4\lambda = a$$
  $\Rightarrow$   $\lambda = \frac{a}{4}$   
 $\mu = 0$   $\Rightarrow$   $\mu = 0$ 

so, 
$$I = \int \frac{\frac{\partial}{\partial x} \left(4x^3\right) + bx}{x^4 + c^2} dx$$

$$I = \frac{\partial}{\partial x} \int \frac{4x^3}{x^4 + c^2} dx + b \int \frac{x}{\left(x^2\right)^2 + c^2} dx$$

$$I = \frac{\partial}{\partial x} \int \frac{4x^3}{x^4 + c^2} dx + \frac{\partial}{\partial x} \int \frac{2x}{\left(x^2\right)^2 + c^2} dx$$

$$= \frac{\partial}{\partial x} \left[ \log \left| x^4 + c^2 \right| + \frac{\partial}{\partial x} I_1 - \dots - I_n \right]$$

Now,

$$I_1 = \int \frac{2x}{\left(x^2\right)^2 + c^2} dx$$

Put 
$$x^2 = t$$

$$\Rightarrow 2x dx = dt$$

$$I_1 = \int \frac{1}{(t)^2 + c^2} dx$$

$$= \frac{1}{c} \tan^{-1} \left(\frac{t}{c}\right) + c_1$$

$$I_1 = \frac{1}{c} \tan^{-1} \left(\frac{x^2}{c}\right) + c_1 - \cdots - (ii)$$

Using equation (ii) in equation (i),

$$I = \frac{a}{4} \log \left| x^4 + c^2 \right| + \frac{b}{2c} \tan^{-1} \left( \frac{x^2}{c} \right) + k$$

K = Integration constant
