

Factorisation of Algebraic Expressions Ex 5.4 Q15

## Answer:

The given expression is

$$x^3 + v^3 - 12xv + 64$$

It is given that

$$x + y = -4$$

$$\Rightarrow x + y + 4 = 0$$

The given expression can be written in the form

$$x^{3} + y^{3} - 12xy + 64 = x^{3} + y^{3} + 64 - 12xy$$
$$= (x)^{3} + (y)^{3} + (4)^{3} - 3.(x).(y).(4)$$

Recall the formula

$$a^{3} + b^{3} + c^{3} - 3abc = (a+b+c)(a^{2} + b^{2} + c^{2} - ab - bc - ca)$$

Using the above formula, we have

$$x^{3} + y^{3} - 12xy + 64$$

$$= (x + y + 4)\{(x)^{2} + (y)^{2} + (4)^{2} - (x).(y) - (y).(4) - (4).(x)\}$$

$$= (x + y + 4)(x^{2} + y^{2} + 16 - xy - 4y - 4x)$$

$$= 0.(x^{2} + y^{2} + 16 - xy - 4y - 4x)$$

$$= \boxed{0}$$

Factorisation of Algebraic Expressions Ex 5.4 Q16

## Answer:

(i) The given expression is

$$x^2 + y^2 + z^2 - xy + xz + yz$$

We have to multiply the above expression by (x+y-z).

The required product is

$$(x+y-z)(x^2+y^2+z^2-xy+xz+yz)$$
=\{x+y+(-z)\}\{(x)^2+(y)^2+(-z)^2-x.y-y.(-z)-(-z).x\}

Recall the formula

$$a^{3} + b^{3} + c^{3} - 3abc = (a+b+c)(a^{2} + b^{2} + c^{2} - ab - bc - ca)$$

Using the above formula, we have

$$= x^3 + y^3 + (-z)^3 - 3.x.y.(-z)$$

$$= x^3 + y^3 - z^3 + 3xyz$$

(ii) The given expression is

$$x^2 + 4y^2 + z^2 + 2xy + xz - 2yz$$

We have to multiply the above expression by (x-2y-z).

The required product is

$$(x-2y-z)(x^2+4y^2+z^2+2xy+xz-2yz)$$
=  $\{x+(-2y)+(-z)\}\{(x)^2+(-2y)^2+(-z)^2-x.(-2y)-(-2y).(-z)-(-z).x\}$ 

Recall the formula

$$a^{3} + b^{3} + c^{3} - 3abc = (a+b+c)(a^{2} + b^{2} + c^{2} - ab - bc - ca)$$

Using the above formula, we have

$$= x^{3} + (-2y)^{3} + (-z)^{3} - 3.x.(-2y).(-z)$$

$$= x^3 - 8y^3 - z^3 - 6xyz$$

(iii) The given expression is

$$x^2 + 4y^2 + 2xy - 3x + 6y + 9$$

We have to multiply the above expression by (x-2y+3).

The required product is

$$(x-2y+3)(x^2+4y^2+2xy-3x+6y+9)$$
=  $\{x+(-2y)+3\}\{(x)^2+(-2y)^2+(3)^2-x.(-2y)-(-2y).(3)-(3).x\}$ 

Recall the formula

$$a^{3} + b^{3} + c^{3} - 3abc = (a+b+c)(a^{2} + b^{2} + c^{2} - ab - bc - ca)$$

Using the above formula, we have

$$= x^{3} + (-2y)^{3} + (3)^{3} - 3.x.(-2y).(3)$$
$$= x^{3} - 8y^{3} + 27 + 18xy$$

(iii) The given expression is

$$9x^2 + 25y^2 + 15xy + 12x - 20y + 16$$

We have to multiply the above expression by (3x-5y+4).

The required product is

$$(3x-5y+4)(9x^2+25y^2+15xy+12x-20y+16)$$
=  $\{3x+(-5y)+4\}\{(3x)^2+(-5y)^2+(4)^2-3x.(-5y)-(-5y).(4)-(4).3x\}$ 

Recall the formula

$$a^{3} + b^{3} + c^{3} - 3abc = (a+b+c)(a^{2} + b^{2} + c^{2} - ab - bc - ca)$$

Using the above formula, we have

$$= (3x)^3 + (-5y)^3 + (4)^3 - 3.3x.(-5y).(4)$$
$$= 27x^3 - 125y^3 + 64 + 180xy$$
