

Triangles Ex 4.6 Q19

Answer:

Given: In \triangle ABC, PQ is a line segment intersecting AB at P, and AC at Q. AP = 1cm, PB = 3cm, AQ = 1.5cm and QC = 4.5cm.

To find:
$$Ar(\Delta APQ) = \frac{1}{16}(\Delta ABC)$$

In ΔABC,

 $\frac{AP}{PB} = \frac{AQ}{QC}$ $\frac{1}{3} = \frac{1.5}{4.5}$ $\frac{1}{3} = \frac{1}{3}$

According to converse of basic proportionality theorem if a line divides any two sides of a triangle in the same ratio, then the line must be parallel to the third side.

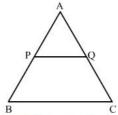

Hence, PQ | BC

In ΔAPQ and ΔABC,

 $\angle APQ = \angle B$ (Corresponding angles)

 $\angle PAQ = \angle BAC$ (Common)

So, $\triangle APQ - \triangle ABC$ (AA Similarity)

We know that the ratio of areas of two similar triangles is equal to the ratio of squares of their corresponding sides.

Hence

$$\frac{Ar(\Delta APQ)}{Ar(\Delta ABC)} = \frac{AP^2}{AB^2}$$

$$= \frac{AP^2}{(AP+BP)^2}$$

$$= \frac{1^2}{(1+3)^2} (given)$$

$$\frac{Ar(\Delta APQ)}{Ar(\Delta ABC)} = \frac{1}{16}$$

$$Ar(\Delta APQ) = \frac{1}{16} Ar(\Delta ABC)$$

Triangles Ex 4.6 Q20

Answer:

Given: In ΔABC, D is a point on side AB such that AD: DB= 3: 2. E is a point on side BC such

that DE || AC

To find: $\frac{\Delta ABC}{\Delta BDE}$

In ΔABC,

 $\frac{AD}{DB} = \frac{3}{2}$

Since DE||AC,

 $\frac{EC}{EB} = \frac{3}{2}$

According to converse of basic proportionality theorem if a line divides any two sides of a triangle in the same ratio, then the line must be parallel to the third side.

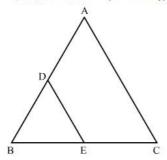

Hence DE | AC

In ΔBDE and ΔABC,

 $\angle BDE = \angle A$ (Corresponding angles)

 $\angle DBE = \angle ABC$ (Common)

So, $\triangle BDE$ - $\triangle ABC$ (AA Similarity)

We know that the ratio of areas of two similar triangles is equal to the ratio of squares of their corresponding sides.

Let AD = 2x and BD = 3x. Hence

$$\frac{Ar(\Delta ABC)}{Ar(\Delta BDE)} = \frac{AB^2}{BD^2}$$

$$= \frac{(BD+DA)^2}{(BD)^2}$$

$$= \frac{(3x+2x)^2}{(2x)^2}$$

$$= \frac{(5x)^2}{(2x)^2}$$

$$\frac{Ar(\Delta ABC)}{Ar(\Delta BDE)} = \frac{25}{4}$$
