

## Derivatives as a Rate Measurer Ex 13.2 Q8

Let AB be the lamp-post. Suppose at time t, the man CD is at a distance of x meters from the lamp-post and y meters be the length of his shadow CB.

Here, 
$$\frac{dx}{dt}$$
 = 5 km/hr  
 $CD$  = 2 m,  $AB$  = 6 m

Here,  $\triangle ABE$  and  $\triangle CDE$  are similar, so

$$\frac{AB}{CD} = \frac{AE}{CE}$$

$$\frac{6}{2} = \frac{x+y}{y}$$

$$3y = x+y$$

$$2y = x$$

$$2\frac{dy}{dt} = \frac{dx}{dt}$$

$$\frac{dy}{dt} = \frac{5}{2} \text{ km/hr}$$

So, the length of his shadow increases at the rate of  $\frac{5}{2}$  km/hr.

## Derivatives as a Rate Measurer Ex 13.2 Q9

The area of a circle (A) with radius (r) is given by  $A = \pi r^2$ .

Therefore, the rate of change of area (A) with respect to time (t) is given by,

$$\frac{dA}{dt} = \frac{d}{dt} \left(\pi r^2\right) = \frac{d}{dr} \left(\pi r^2\right) \frac{dr}{dt} = 2\pi r \frac{dr}{dt} \text{ [By chain rule]}$$

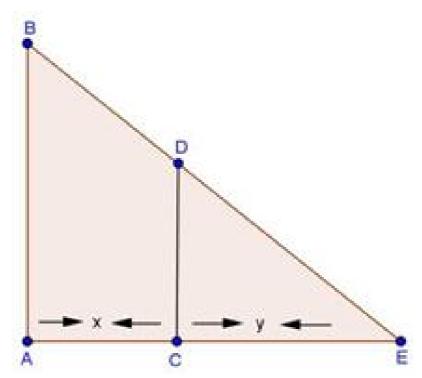

It is given that  $\frac{dr}{dt} = 4$  cm/s

Thus, when r = 10cm,

$$\frac{dA}{dt} = 2\pi \left(10/4\right) = 80\pi$$

Hence, when the radius of the circular wave is 8 cm, the enclosed area is increasing at the rate of  $80\pi\,\mathrm{cm}^2/\mathrm{s}$ 

Derivatives as a Rate Measurer Ex 13.2 Q10

Let  $\mathit{AB}$  be the height of pole. Suppose at time t, the man  $\mathit{CD}$  is at a distance of x meters from the lamp-post and y meters be the length of his shadow  $C\!E$ , then

$$\frac{dx}{dt} = 1.1 \text{ m/sec}$$

 $\triangle ABE$  is similar to  $\triangle CDE$ ,

$$\frac{AB}{CD} = \frac{AE}{CE}$$

$$\frac{600}{160} = \frac{x+3}{y}$$

$$\frac{15}{4} = \frac{x+y}{y}$$

$$15y = 4x$$

$$11\frac{dy}{dx} = 4\frac{dx}{dx}$$

$$\frac{dy}{dx} = \frac{4}{4}(1.1)$$

is similar to 
$$\triangle CDE$$

$$\frac{AB}{CD} = \frac{AE}{CE}$$

$$\frac{600}{160} = \frac{x+y}{y}$$

$$\frac{15}{4} = \frac{x+y}{y}$$

$$15y = 4x + 4y$$

$$11y = 4x$$

$$11\frac{dy}{dx} = 4\frac{dx}{dt}$$

$$\frac{dy}{dt} = \frac{4}{11}(1.1)$$

$$\frac{dy}{dt} = 0.4 \text{ m/sec}$$

Rate of increasing of shadow = 0.4 m/sec.
