

Q5. How does the budget line change if the consumer's income increases to Rs. 40 but the prices remain unchanged?

Ans:
$$M_2$$
 = Rs. 40

$$P_1 = Rs. 4$$

$$P_2 = Rs. 5$$

Initial equation of the budget line:

$$4x_1 + 5x_2 = 20$$

New equation of the budget line:

$$4x_1 + 5x_2 = 40$$

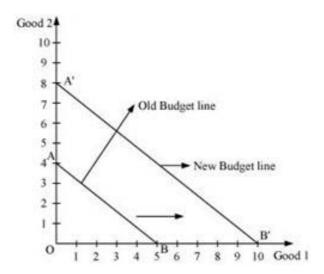

As M has increased, the consumer can now purchase more of both the goods and the budget line will shift parallelly outwards to A'B' from AB.

Horizontal intercept will be =
$$\frac{M}{P_2} = \frac{40}{4} = 10$$

Vertical intercept will be=
$$\frac{M}{P_2} = \frac{40}{5} = 8$$

The slope of the new budget line will be the same as that of the old budget line.

$$\frac{-P_1}{P_2} = \frac{4}{5}$$

Q6. How does the budget line change if the price of good 2 decreases by a rupee but the price of good 1 and the consumer's

income remain unchanged?

Ans: $P_1 = \text{Rs. 4}$

 $P_2 = Rs. 5$

 $P_2^1 = \text{Rs. 4}$

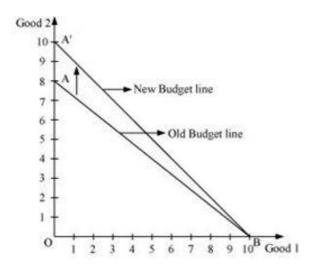

M = Rs. 20

Since the income and the price of good 1 are unchanged, the decrease in the price of good 2 will increase the vertical intercept of the budget line. The new budget line will also pivot outwards around the same horizontal intercept.

Horizontal intercept will be = $\frac{M}{P_1} = \frac{40}{4}$

Vertical intercept will be= $\frac{M}{P_1} = \frac{40}{4}$

Slope =
$$\frac{-P_1}{P_2} = \frac{4}{4} = 1$$

The slope of the new budget line will be more and the new budget line will be steeper than the original one.
