

Exercise 14H

## Question 10:

We may prepare the table, given below:

Marks (x)	No of students (f)	Cumulative Frequency	f×x
4	8	8	32
12	10	18	120
20	16	34	320
28	24	58	672
36	15	73	540
44	7	80	308
	∑f=N=80		$\sum f \times x = 1992$

Here, n = 80, which is even.

$$\therefore \text{ median} = \frac{1}{2} \left[ \left( \frac{n}{2} \right) \right] \text{th term} + \left( \frac{n}{2} + 1 \right) \text{th term}$$

$$= \frac{1}{2} \left[ \left( 40 \text{th term} + 41 \text{st term} \right) \right] \left[ \because n = 80 \right]$$

$$= \frac{1}{2} \left( 28 + 28 \right)$$

$$= \left( \frac{1}{2} x56 \right) = 28$$
Now,  $\sum f \times x = 1992$  and  $\sum f = 80$ 

Now, 
$$\sum f \times x = 1992$$
 and  $\sum f = 80$ 

$$\therefore$$
 mean =  $\frac{\sum f \times x}{\sum f} = \frac{1992}{80} = 24.9$ 

$$mode = 3(median) - 2(mean)$$
$$= (3x28) - (2x24.9)$$
$$= 84 - 49.8 = 34.2$$

∴ modal marks =34.2

Question 11:

We may prepare the table, given below:

Age (in years) (x)	No. of persons (f)	Cumulative Frequency	f×x
19	13	13	247
21	15	28	315
23	16	44	368
25	18	62	450
27	16	78	432
29	15	93	435
31	13	106	403
	$\sum f = N = 106$		$\sum f \times x = 2650$

Here, 
$$\sum f \times x = 2650$$
, and  $\sum f = 106$ 

mean = 
$$\frac{\sum f \times x}{\sum f} = \frac{2650}{106} = 25$$

Here, N = 106 which is even

$$\therefore \text{ median} = \frac{1}{2} \left[ \left( \frac{n}{2} \right) \text{th term} + \left( \frac{n}{2} + 1 \right) \text{th term} \right]$$

$$= \frac{1}{2} \left[ \left( 53 \text{th term} + 54 \text{th term} \right) \right] \left[ \because n = 106 \right]$$

$$= \frac{1}{2} \left( 25 + 25 \right)$$

$$= \left( \frac{1}{2} \times 50 \right) = 25$$

: median = 25

:. mode =3 (median) - 2(mean)  
=
$$(3x25) - (2x25)$$
  
= $75 - 50 = 25$ 

Thus, mean = 25, median = 25 and mode = 25

\*\*\*\*\*\*\* END \*\*\*\*\*\*
