

Question 26:

∴
$$\angle A = \angle B = \angle C = 60^{\circ}$$

Draw AD \bot BC

In ΔABD and ΔACD,

AD = AD (com m on)

 $\angle ADB = \angle ADC$ (90°)

AB = AC (ΔABC is an equilateral triangle)

∴ ΔABD ≅ ΔACD (RHS congurence criterion)

BD = DC (qct)

 $\angle BAD = \angle CAD$ (qct)

 $\therefore BD = \frac{2a}{2} = a \text{ and } \angle BAD = \frac{60^{\circ}}{2} = 30^{\circ}$

In ∆ABD,

$$\sin 30^\circ = \frac{BD}{AB} = \frac{a}{2a} = \frac{1}{2}$$

Question 27:

∴
$$\angle A = \angle B = \angle C = 60^{\circ}$$

Draw AD \bot BC

In ΔABD and ΔACD,

$$AD = AD$$
 (com m on)

$$\angle ADB = \angle ADC$$
 (90°)

$$\angle BAD = \angle CAD$$
 (qpct)

$$\therefore BD = \frac{2a}{2} = a \text{ and } \angle BAD = \frac{60^{\circ}}{2} = 30^{\circ}$$

In $\triangle ABD$, $\angle D = 90^{\circ}$

By Pythagoras theorem,

$$AB^2 = BD^2 + DA^2$$

$$DA^2 = AB^2 - BD^2$$

$$DA^2 = (2a)^2 - a^2$$

$$=4a^2-a^2=3a^2$$

In AABD,

$$\sin 60^{\circ} = \frac{AD}{DB} = \frac{\sqrt{3} \text{ a}}{2\text{a}} = \frac{\sqrt{3}}{2}$$

********* END ********
