

Relations Ex 1.1 Q11

No, it is not necessary that a relation which is symmetric and transitive is reflexive as well.

For Example,

Let
$$A = \{a, b, c\}$$
 be a set and

$$R_2 = \{(a, a)\}$$
 is a relation defined on A.

Clearly,

 \mathcal{R}_2 is symmetric and transitive but not reflexive.

Relations Ex 1.1 Q12

It is given that an integer m is said to be relative to another integer n if m is a multiple of n.

In other words

$$R = \left\{ \left(m, n\right); \quad m = kn, k \in z \right\}$$

Reflexivity: Let, m ∈ z

$$\Rightarrow m = 1.m$$

$$\Rightarrow$$
 $(m,m) \in R$

∴ R is reflexive

Transitive: Let $(a,b) \in R$ and $(b,c) \in R$

$$\Rightarrow$$
 $a = kb$ and $b = k'c$

$$\Rightarrow \qquad a = kk'c \qquad \qquad \left[: \qquad kk' \in Z \right]$$

$$\Rightarrow \quad a = lc \qquad \qquad \left[\therefore \qquad l = kk' \in Z \right]$$

$$\Rightarrow$$
 $(a,c) \in R$

.. R is transitive

Symmetric: Let $(a,b) \in R$

$$\Rightarrow b = \frac{1}{k} a \quad \text{but } \frac{1}{k} \notin z \text{ if } k \in z$$

.. R is not symmetric

Relations Ex 1.1 Q13

```
We have,
  relation R = " \ge " on the set R of all real numbers
 Reflexivity: Let a ∈ R
             a≥a
  \Rightarrow
             "≥" is reflexive
  Symmetric: Let a,b \in R
             such that a≥b ⇒ b≥a
             "≥" not symmetric
  Transitivity: Let a,b,c \in R
             and a \ge b & b \ge c
             a≥c
  \Rightarrow
             "≥" is transitive
Relations Ex 1.1 Q14
(i )Let A = \{4, 6, 8\}.
Define a relation R on A as:
A = \{(4, 4), (6, 6), (8, 8), (4, 6), (6, 4), (6, 8), (8, 6)\}
Relation R is reflexive since for every a \in A, (a, a) \in R i.e., (4, 4), (6, 6), (8, 8) \in R.
Relation R is symmetric since (a, b) \in R \Rightarrow (b, a) \in R for all a, b \in R.
Relation R is not transitive since (4, 6), (6, 8) \in R, but (4, 8) \notin R.
Hence, relation R is reflexive and symmetric but not transitive.
(ii ) Define a relation R in R as:
R = \{a, b\}: a^3 \ge b^3\}
Clearly (a, a) \in R as a^3 = a^3.
                                                                            a = a.
Therefore, R is reflexive.
Now, (2, 1) \in R (as 2^3 \ge 1^3)
```

But, $(1, 2) \notin \mathbb{R}$ (as $2^3 \ge 1^3$)

Therefore, R is not symmetric.

Now, Let (a, b), $(b, c) \in R$.

 \Rightarrow $a^3 \ge b^3$ and $b^3 \ge c^3$

 $\Rightarrow a^3 \ge c^3$

 \Rightarrow $(a, c) \in R$

Therefore, R is transitive.

Hence, relation R is reflexive and transitive but not symmetric.

Hence, relation R is transitive but not reflexive and symmetric.

```
(iv)Let A = \{5, 6, 7\}.
Define a relation R on A as R = \{(5, 6), (6, 5)\}.
Relation R is not reflexive as (5, 5), (6, 6), (7, 7) \notin R.
Now, as (5, 6) \in R and also (6, 5) \in R, R is symmetric.
\Rightarrow (5, 6), (6, 5) \in R, but (5, 5) \notin R
Therefore, R is not transitive.
Hence, relation R is symmetric but not reflexive or transitive.
(v)Consider a relation R in {\bf R} defined as:
R = \{(a, b): a < b\}
For any a \in \mathbb{R}, we have (a, a) \notin \mathbb{R} since a cannot be strictly less than a itself. In fact, a = a.
Therefore, R is not reflexive.
Now, (1, 2) \in R \text{ (as } 1 < 2)
But, 2 is not less than 1.
Therefore, (2, 1) ∉ R
Therefore, R is not symmetric.
Now, let (a, b), (b, c) \in \mathbb{R}.
\Rightarrow a < b \text{ and } b < c
\Rightarrow a < c
\Rightarrow (a, c) \in R
Therefore, R is transitive.
Hence, relation R is transitive but not reflexive and symmetric.
