

Understanding shapes-III special types of quadrilaterals Ex 17.1 Q6 **Answer**:

In the parallelogram RISK:

$$\angle ISK + \angle RKS = 180^{\circ}$$
 (sum of adjacent angles of a parallelogram is  $180^{\circ}$ )

$$\angle ISK = 180^{\circ} - 120^{\circ} = 60^{\circ}$$

Similarly, in parallelogram CLUE:

 $\angle CEU = \angle CLU = 70^{\circ}$  (opposite angles of a parallelogram are equal)

In the triangle:

$$x + \angle ISK + \angle CEU = 180^{\circ}$$

$$x = 180^{\circ} - (70^{\circ} + 60^{\circ})$$

$$x = 180^{\circ} - (70^{\circ} + 60^{\circ}) = 50^{\circ}$$

Understanding shapes-III special types of quadrilaterals Ex 17.1 Q7

## Answer:

Oppostie angles of a parallelogram are congurent.

$$(3x-2)^{\circ} = (50-x)^{\circ}$$

$$3x^{\circ} - 2^{\circ} = 50^{\circ} - x^{\circ}$$

$$3x^{\circ} + x^{\circ} = 50^{\circ} + 2^{\circ}$$

$$4x^{\circ} = 52^{\circ}$$

$$x^{\circ} = 13^{\circ}$$

Putting the value of x in one angle:

$$3x^{\circ}-2^{\circ}=39^{\circ}-2^{\circ}$$

$$=37^{\circ}$$

Opposite angles are congurent:

$$\therefore 50-x^{\circ}$$

$$=37^{\circ}$$

Let the remaining two angles be y and z.

Angles y and z are congurent because they are also opposite angles.

$$\therefore y = z$$

The sum of adjacent angles of a paralle  $\log ram$  is equal to  $180^{\circ}$ .

$$\therefore 37^{\circ} + y = 180^{\circ}$$

$$y = 180^{\circ} - 37^{\circ}$$

$$y = 143^{\circ}$$

So, the anlges measure are:

Understanding shapes-III special types of quadrilaterals Ex 17.1 Q8 Answer:

Two adjacent angles of a parallelogram add up to 180°.

Let x be the angle.

$$x + \frac{2x}{3} = 180^{\circ}$$

$$\frac{5x}{3} == 180^{\circ}$$

$$x = 72^{\circ}$$

$$\frac{2x}{3} = \frac{2 \times 72^{\circ}}{3} = 108^{\circ}$$

Thus, two of the angles in the parallelogram are  $108^{\circ}$  and the other two are  $72^{\circ}$ .
