

Exponents of Real Numbers Ex 2.1 Q4

Answer:

We are given $27^x = \frac{9}{3^x}$. We have to find the value of x

Since
$$\left(3^3\right)^x = \frac{3^2}{3^x}$$

By using the law of exponents $\frac{a^m}{a^n} = a^{m-n}$ we get,

$$3^{3x} = 3^{2-x}$$

On equating the exponents we get,

$$3x = 2 - x$$

$$3x + x = 2$$

$$4x = 2$$

$$x = \frac{2}{4}$$

$$x = \frac{1}{2}$$

Hence,
$$x = \frac{1}{2}$$

Exponents of Real Numbers Ex 2.1 Q5

Answer:

From the following we have to find the value of x

(i) Given
$$2^{5x} \div 2^x = \sqrt[5]{2^{20}}$$

By using rational exponents $\frac{a^m}{a^n} = a^{m-n}$

$$2^{5x-x} = 2^{20 \times \frac{1}{5}}$$

$$2^{5x-x} = 2^{\frac{4}{26} \times \frac{1}{5}}$$

On equating the exponents we get,

$$5x - x = 4$$

$$4x = 4$$

$$x = \frac{4}{4}$$

$$x = \frac{\cancel{A}}{\cancel{A}}$$

$$x = 1$$

The value of x is $\boxed{1}$
