

Linear Equations in One Variable Ex 9.4 Q21

Answer:

Let the denominator be x.

$$\therefore$$
 The numerator $=\frac{x+2}{2}$

$$\therefore$$
 The rational number = $\frac{x+2}{2x}$

According to the question,

$$\frac{\frac{x+2}{2}+3}{\frac{2}{x+3}} = \frac{2}{3}$$
or $\frac{x+2+6}{2(x+3)} = \frac{2}{3}$
or $\frac{x+8}{2x+6} = \frac{2}{3}$
or $3x + 24 = 4x + 12$
or $x = 24 - 12$
or $x = 12$

$$\therefore \text{ The rational number} = \frac{12+2}{2\times 12} = \frac{14}{24} = \frac{7}{12}$$

Linear Equations in One Variable Ex 9.4 Q22

Answer:

Let, the speed of the first train be x km/h.

Then, the speed of the other train will be (x + 5) km/h.

2 hours after they started:

Distance of the first train from the starting point = 2x km

Distance of the other train from the starting point = 2(x + 5) km

$$2(x + 5) + 2x + 30 = 340$$
or $4x + 10 + 30 = 340$
or $4x = 340 - 40$
or $x = \frac{300}{4} = 75$

 \therefore Speed of the first train = 75 km/h.

Speed of the other train = (75 + 5) = 80 km/h.

Linear Equations in One Variable Ex 9.4 Q23

Answer:

It is given that the speed of the stream is 1 km/h. Let the speed of the steamer in still water be x km/h.

 \therefore Downstream speed = (x + 1) km/hUpstream speed = (x - 1) km/h

The downstream and upstream distances are same; therefore, we have:

$$9(x + 1) = 10(x - 1)$$

or $9x + 9 = 10x - 10$
or $x = 19$

 \therefore Speed of the steamer in still water = 19 km/h.

Distance between the ports = 9(19 + 1) = 180 km.
