

## Factorisation of Algebraic Expressions Ex 5.1 Q1

#### Answer:

The given expression to be factorized is

$$x^3 + x - 3x^2 - 3$$

Take common x from the first two terms and -3 from the last two terms. That is

$$x^3 + x - 3x^2 - 3 = x(x^2 + 1) - 3(x^2 + 1)$$

Finally, take common  $x^2 + 1$  from the two terms. That is

$$x^{3} + x - 3x^{2} - 3 = x(x^{2} + 1) - 3(x^{2} + 1)$$
$$= (x^{2} + 1)(x - 3)$$

We cannot further factorize the expression.

So, the required factorization is  $x^3 + x - 3x^2 - 3 = (x^2 + 1)(x - 3)$ 

### Factorisation of Algebraic Expressions Ex 5.1 Q2

#### Answer

The given expression to be factorized is

$$a(a+b)^3 - 3a^2b(a+b)$$

Take common a(a+b) from the two terms. That is

$$a(a+b)^3 - 3a^2b(a+b) = a(a+b)\{(a+b)^2 - 3ab\}$$

Expand the term  $(a+b)^2$  within the second braces.

$$a(a+b)^3 - 3a^2b(a+b)$$

$$= a(a+b)\{(a+b)^2 - 3ab\}$$

$$= a(a+b)\{(a^2+2ab+b^2)-3ab\}$$

$$= a(a+b)(a^2+2ab+b^2-3ab)$$

$$= a(a+b)(a^2+b^2-ab)$$

We cannot further factorize the expression.

So, the required factorization of  $a(a+b)^3 - 3a^2b(a+b)$  is  $a(a+b)(a^2+b^2-ab)$ 

# Factorisation of Algebraic Expressions Ex 5.1 Q3 Answer:

The given expression to be factorized is

$$x(x^3-y^3)+3xy(x-y)$$

We know that

$$x^3 - y^3 = (x - y)(x^2 + xy + y^2)$$

The given expression then becomes

$$x(x-y)(x^2 + xy + y^2) + 3xy(x-y)$$

Take common x(x-y) from the two terms. That is

$$x(x-y)(x^2 + xy + y^2) + 3xy(x-y)$$

$$= x(x-y)\{(x^2 + xy + y^2) + 3y\}$$

$$=x(x-y)(x^2+xy+y^2+3y)$$

$$=x(x-y)(x^2+xy+y^2+3y)$$

We cannot further factorize the expression.

So, the required factorization of  $x(x-y)(x^2+xy+y^2)+3xy(x-y)$  is  $x(x-y)(x^2+xy+y^2+3y)$
