Higher Order Derivatives Ex 12.1 Q50

$$y = Ae^{-kt} \cos(pt + c)$$

differentiating w.r.t. t

$\Rightarrow \quad \dfrac{dy}{dt} = A\left\{e^{-kt}\left(-\sin(pt+c) \times p\right) + \left(\cos(pt+c)\right)\left(-re^{-kt}\right)\right\}$

$\Rightarrow \quad -Ape^{-kt}\sin(pt+c) - kAe^{-kt}\cos(pt+c)$

$\Rightarrow \quad \dfrac{dy}{dt} = -Ape^{-kt}\sin(pt+c) - ky$

differentiating w.r.t. t

$\Rightarrow \quad \dfrac{d^2y}{dt^2} = -Ap\left\{e^{-kt}\left(\cos(pt+c)\times p\right) + \left(\sin(pt+c)\right)\left(e^{-kt}\times -R\right) - ky^1\right\}$

$\qquad = -p^2y + Apke^{-kt}\sin(pt+c) - ky^1$

Adding & subtracting ky^1 on RHS

$\Rightarrow \quad \dfrac{d^2y}{dt^2} = +Apke^{-kt}\sin(pt+c) - p^2y - 2ky^1 + ky^1$

$\qquad \dfrac{d^2y}{dt^2} = Apke^{-kt}\sin(pt+c) - p^2y - 2ky^1 - kApe^{-kt}\sin(pt+c) - k^2y$

$\Rightarrow \quad \dfrac{d^2y}{dt^2} = -\left(p^2 + k^2\right)y - 2k\dfrac{dy}{dx}$

$\Rightarrow \quad \dfrac{d^2y}{dt^2} + 2k\dfrac{dy}{dt} + n^2y = 0$

Hence proved!
